Conservation of Coastal and Marine Biodiversity
in the Western Indian Ocean
February 2005

IUCN - EASTERN AFRICA MARINE & COASTAL ECOSYSTEMS PROGRAMME

The aim of IUCN's Eastern Africa Marine & Coastal Ecosystems Programme, which has been operating since 1992, is to maintain the biodiversity and ecological processes of marine and coastal ecosystems in Eastern Africa, to restore their functioning where this has been impaired, and to facilitate the sustainable and equitable use of marine resources. Current priorities include: the establishment and effective management of marine protected areas, sustainably managed fisheries and integrated coastal zone management.

THE NAIROBI CONVENTION

The Nairobi Convention for the Protection, Management and Development of the Marine and Coastal Environment of the Eastern African region came into force in 1985. The convention has two protocols; one on Protected Areas and Wild Fauna and Flora and one concerning Cooperation in Combating Marine Pollution in cases of Emergency in the Eastern Africa Region. All the Western Indian Ocean States of Comoros, Kenya, Madagascar, Mauritius, Mozambique, Réunion (France), Seychelles, Somalia, South Africa and Tanzania have ratified the Convention and the two protocols. The United Nations Environment Programme (UNEP) is the Secretariat of the Convention and is responsible for organizing a meeting of the Conference of Parties every two years to review progress and to develop new work programmes. The Regional Coordinating Unit in the Seychelles promotes programmes and projects that enable nations and the people of the Eastern Africa Region and their partners to protect, manage and develop their marine and coastal resources in a sustainable way. Current priority areas include: coral reefs and associated ecosystems; land based sources of pollution; marine protected areas; and coordination with other regional programmes and partnerships.

CONVENTION ON BIOLOGICAL DIVERSITY

The Convention on Biological Diversity (CBD) entered into force in 1993. It is the only global treaty that addresses the three levels of biological diversity: genetic resources, species and ecosystems. It is also the first to recognise that conservation of biological diversity is a common concern of humankind, that investments in conserving biodiversity will result in environmental, economic and social benefits, and that economic and social development and poverty eradication are priority tasks. Its triple objectives are to conserve biological diversity, to use the components of biological diversity in a sustainable way, and to share equitably the benefits arising out of genetic resources. 188 countries and the European Community have ratified the Convention. They have committed themselves to developing national biodiversity strategies and action plans and to integrating the conservation and sustainable use of biodiversity into decision-making across all economic sectors.

The Jakarta Mandate is a global consensus on the importance of Marine and Coastal Biodiversity endorsed at the second meeting of the Convention of Parties of the CBD in Jakarta in 1996. Five principle action areas were agreed.

THE WESTERN INDIAN OCEAN MARINE BIODIVERSITY CONSERVATION PROJECT

The Western Indian Ocean Marine Biodiversity Conservation Project was initiated in February 2000, when the IUCN Eastern Africa Regional Programme (EARP) organised a workshop in Mombasa, Kenya, to address implementing the Jakarta Mandate within the Eastern African region. The meeting was attended by representatives of six of the Parties to the Nairobi Convention, and a number of regional organisations. Three priority results were identified from the five themes listed under the Jakarta Mandate: 1) Integrated Marine and Coastal Area Management, 2) Sustainable Use of Marine Living Resources and 3) Establishment and Maintenance of Marine Protected Areas. Under these result areas, a number of Sub Results with proposed activities were identified. The Project is coordinated by IUCN's EARP through the Regional Co-ordinator, Marine and Coastal Ecosystems and is overseen by a Task Force with members from six of the WIO/Nairobi Convention countries: Kenya, Madagascar, Mozambique, Seychelles, South Africa, and Tanzania. The Western Indian Ocean Marine Science Association, World Wide Fund for Nature-Tanzania and United Nations Environment Programme also have representatives on the Task Force.

A Workbook for Assessing Management Effectiveness of Marine Protected Areas in the Western Indian Ocean

ACKNOWLEDGEMENTS

We are grateful to all those that participated in the pilot assessments particularly: the Kenya Wildlife Service (KWS) Wardens from Kisite and Mpunguti Marine Park and Reserve, Mombasa Marine Park and Reserve, Malindi and Watamu Marine Park and Reserve and Kiunga Marine National Reserve, Kenya; Sam Weru and Ben Kavu from the KWS Marine Park Headquarters in Mombasa, Kenya; Dishon Murage from World Wide Fund for Nature, Kiunga Marine National Reserve, Kenya; the Wardens and their staff from Mafia Island Marine Park and Mnazi Bay Ruvuma Estuary Marine Park in Tanzania; Mr Rumisha from the Marine and Reserve Parks Unit, Tanzania; and Kerstin Henri and Nirmal Shah of Nature Seychelles for the Cousin Island Special Reserve assessment. We would also like to thank Nyawira Muthiga for her efforts in rallying together five managers in Kenya, and her ongoing commitment to the process; and many from IUCN-EARO including Gordon Otieno for assistance with design; Wahida Shah and Dalmas Oyugi for their commitment and input during the pilot assessments and the initial stages of the report, and Melita Samoilys and Julie Church for editing the workbook. Photographs have been provided by the authors and also generously been donated by Melita Samoilys, Mathew Richmond, Nyawira Muthiga, Julie Church, Dishon Murage and Rudy van der Elst. The pilot assessments and the production of this workbook were made possible with financial support from United Nations Environmental Programme, International Coral Reef Action Network, the Norwegian Agency for Development Corporation and IUCN.

PREFACE

Increasingly governments and civil society want accountability and evidence that setting aside areas of land and sea for biodiversity conservation is worthwhile. Accountability is also required at the international level. The Convention on Biological Diversity (CBD) requires parties to report on the status of their protected areas and has recommended that countries should carry out management effectiveness assessments of at least 30% of their protected areas by the year 2010. There is therefore an increasing need to provide tried and tested tools for this.

The need for tools and guidelines to evaluate the ecological and managerial quality of protected areas was first recognised at the 1992 World Parks Congress in Venezuela, with the result that in 1996 IUCN set up a Management Effectiveness Task Force (METF) under the World Commission on Protected Areas (WCPA) to look at this issue. In 2000, a framework methodology was published by IUCN (Hockings *et al.*, 2000a) to provide general guidance in the development of assessment systems for protected areas and to encourage basic standards for assessment and reporting (www.iucn.org/themes/wcpa). This emphasises the importance of promoting a flexible approach to assessments, recognising that the general methodology will need to be adapted to each site. This is a new field and many methods are being developed and tested at present.

IUCN's global programme on improving protected area management through assessment of management effectiveness now involves many partners including the World Wide Fund for Nature (WWF), The Nature Conservancy (TNC), United Nations Educational Scientific and Cultural Organisation (UNESCO), the World Heritage Convention, and the marine component of WCPA. Specific initiatives include WCPA-Marine's manual aimed at helping Marine Protected Areas (MPAs) select and use appropriate indicators for assessing management effectiveness (Pomeroy *et al.*, 2004) and a four-year UNF/UNESCO/IUCN project involving World Heritage Sites ('Enhancing Our Heritage') which includes five Eastern African pilot sites, of which two (Greater St Lucia Wetland Parks and Aldabra Special Reserve) have marine components (Hockings *et al.*, 2004).

This 'Workbook' was produced in order to test and adapt the WCPA methodologies for use at MPAs in the Western Indian Ocean (WIO). It is based mainly on the approach used in the World Heritage project and the WCPA/METF Framework, but reference is made to the WCPA-Marine methodology and explanations of the differences in approach are provided. It has been tested in eight MPAs in three countries in the WIO – Kenya

(Kisite/Mpunguti, Mombasa, Malindi, and Watamu Marine National Parks and Reserves, and Kiunga Marine National Reserve), Tanzania (Mafia Island and Mnazi Bay-Ruvuma Estuary Marine Parks) and Seychelles (Cousin Island Special Reserve).

The WIO Biodiversity Conservation Project, initiated in February 2000, is a partnership project to assist the Contracting Parties to the Nairobi Convention to implement the Jakarta Mandate of the CBD. It is coordinated by the IUCN-Eastern Africa Regional Programme and is overseen by a Task Force with members from six WIO countries and representatives from the Western Indian Ocean Marine Science Association (WIOMSA), WWF, Wildlife Conservation Society (WCS) and the United Nations Environment Programme (UNEP). The project is primarily funded by the Norwegian Agency for Development Cooperation (NORAD). The production of the Workbook addresses the third result area of the project: "establishment and management of marine protected areas" and has been carried out under the oversight of the Eastern African Group of Experts on Marine Protected Areas (GEMPA-EA). The pilot assessments were carried out with the support of the Eastern African component of the International Coral Reef Action Network (ICRAN) that is being implemented through UNEP, with funding from the United Nations Foundation (UNF).

The Workbook is designed to allow for a dynamic process of MPA management based on the lessons learnt from pilot assessments in eight MPAs in Kenya, Tanzania and the Seychelles. The method takes into account the management issues faced in the WIO, is cost effective and encourages self-assessment by the managers. The workbook has a complementary website (www.wiomsa.org) and is available on CD ROM.

The publication Managing Marine Protected Areas: A Toolkit for the Western Indian Ocean (IUCN-EARO) complements the Workbook. The Toolkit was designed to support MPA Managers in the WIO by providing them with a hands-on guide to a diverse array of topics, ranging from monitoring and evaluating projects, conflict resolution, threatened marine species to financial planning. This is available as a hard copy from IUCN-EARO or can be downloaded from the website, (www.wiomsa.org/mpatoolkit/home.htm).

It is intended that the management effectiveness Workbook will serve as a practical tool in assisting MPA managers and practitioners in their crucial role as custodians of marine biodiversity in the WIO.

GLOSSARY OF TERMS USED

Adaptive management is the adjustment of management actions on the basis of lessons learnt over time, in order to improve performance.

Assessment is the judgment or evaluation of the achievement of protected area management against a set of standards or objectives.

Criteria (or indicators) for protected area management effectiveness are quantitative or qualitative measures that provide information about the achievement of the protected area's goals and objectives.

Goals are general descriptions that summarise the desired state of a protected area.

A **learning environment** is one that encourages and fosters the sharing of knowledge, skills and experiences, both within and outside an organisation, so that lessons learnt through conservation and management are not lost, and mistakes are not repeated.

Management effectiveness is the degree to which a protected area is achieving its goals and objectives.

Management targets are a limited number or aggregate, of an MPA's biological, social, cultural and other values that are considered to be the focus of management at the site.

A **marine protected area (MPA)** is defined by IUCN as 'any area of intertidal or subtidal terrain, together with its overlaying water and associated flora, fauna, historical and cultural features, which has been reserved by law or other effective means to protect part or all of the enclosed environment.'

Monitoring is a process of collecting information about one or more elements of the environment, for specific purposes, using comparable standardised monitoring methods at regular intervals over time.

Objectives are specific statements listed under goals that describe the desired outcomes of the protected area.

A **protected area** is defined by IUCN as 'an area of land and/or sea especially dedicated to protection and maintenance of biological diversity, and of natural and associated cultural resources, and managed through legal or other effective means'.

A **standard** is the required level or quality that has to be reached; in other words it is a reference point or ideal situation against which other things can be evaluated.

1. INTRODUCTION

Kufanya kosa siyo kosa. Kosa ni kurudia kosa.

To make a mistake is not a mistake. The mistake is to repeat the mistake.

Bajuni proverb, Kenya

1.1 Why assess MPA management effectiveness?

Most countries in the Western Indian Ocean (WIO) have one or more marine protected areas (MPAs) dedicated to the protection and maintenance of biological diversity, natural resources and cultural heritage values. Of these, two (Greater St Lucia Wetlands Park and Aldabra Atoll) are listed as World Heritage sites under the World Heritage Convention, and another three (Malindi-Watamu and Kiunga-Dodori in Kenya, and Mananara-Nord in Madagascar) are listed as Biosphere Reserves under the UNESCO Man and Biosphere Programme in recognition of their global value. Experience has shown that it is not simply enough to declare or legally gazette an area as an MPA, although this is a vitally important step. The long-term success of an MPA depends on effective management combined with demonstration of its usefulness and appropriateness as a conservation and management tool within its local and national context.

Management effectiveness is the degree to which a protected area is achieving its objectives and goals.

The main aim of assessing management effectiveness is to improve performance of the MPA, through **adaptive management** – adjusting management actions on the basis of lessons learnt over time. Assessment should be seen as a normal and essential component of the process of MPA management.

It is not only important for looking for problems and finding solutions, but it is also a way of identifying what is working well, so that a **learning environment** is created. A learning environment is one that encourages the sharing of knowledge, skills and experiences both within and outside an organisation, so that lessons learnt are not lost and mistakes are not repeated. A learning environment does not focus on what was successful and what failed, but on the 'lessons learnt' and how others might benefit from these experiences.

Management effectiveness can be **assessed** by looking at changes in the biophysical and socioeconomic environment as a result of the presence of the MPA, and also at the structures, activities and processes involved in management itself. Assessment should include issues within and/or beyond the control of individual managers.

Once the results of an assessment are known, management can be improved by adapting processes, making new interventions, developing more strategic plans, and improving resources. **Monitoring** programmes, which are essential for tracking progress, can also be improved or introduced; the assessment will show that these should not be limited to the biophysical and socioeconomic environment, but should include the management process itself.

There are other reasons for assessing management effectiveness. The assessment can lead to improved accountability and reporting, and can assist with planning for the future. MPA managers can use the results to improve their performance, report on their achievements, or highlight issues for which they require more support or additional funds. Policy makers, conservationists and funding agencies can use the results to highlight problems, set priorities, and promote better management policies and practices. It can also lead to the identification of new strategic partnerships and/or the improvement of existing partnerships (e.g. with stakeholders or other external agencies), to ensure the management needs of an MPA are met.

1.2 The management cycle and components of the assessment

The framework for assessing management effectiveness developed by IUCN's World Commission for Protected Areas (WCPA) is based on the idea that there are six stages or elements to good management (Fig. 1). Management:

- begins with establishing the **context** of existing values and threats (where are we now?),
- progresses through **planning** (where do we want to be and how will we get there?), and
- allocation of resources or **inputs** (what do we need?), and
- as a result of management actions or **process** (how do we go about it?),
- eventually produces goods and services or **outputs** (what did we do and what did we produce?), that
- result in impacts or **outcomes** (what did we achieve?)

These components can be seen as different parts of a cycle. Each component should be monitored and assessed, and the results of the assessment should be used to make changes to (i.e. adapt) management actions so that the overall management of the MPA continues to improve or inappropriate interventions are amended or halted.

The six components cover the three key aspects of protected area established and management (Fig. 2).

Context and planning relate to the **design** of the MPA, inputs and process to **management systems/processes**, and outputs and outcomes the **delivery of objectives**.

How appropriate is the design?

- What is the **context** in which the MPA has been set up/is being implemented?
- How good is the **planning**?

How appropriate are the management systems and processes?

- What **inputs** are needed?
- What management **process** is being used – how is management structured and conducted and how are the management plans and work plans implemented?

Are the objectives being met?

- What activities were undertaken and what were the **outputs** or products?
- What impacts or **outcomes** were achieved?

Figure 1: The management cycle and adaptive management

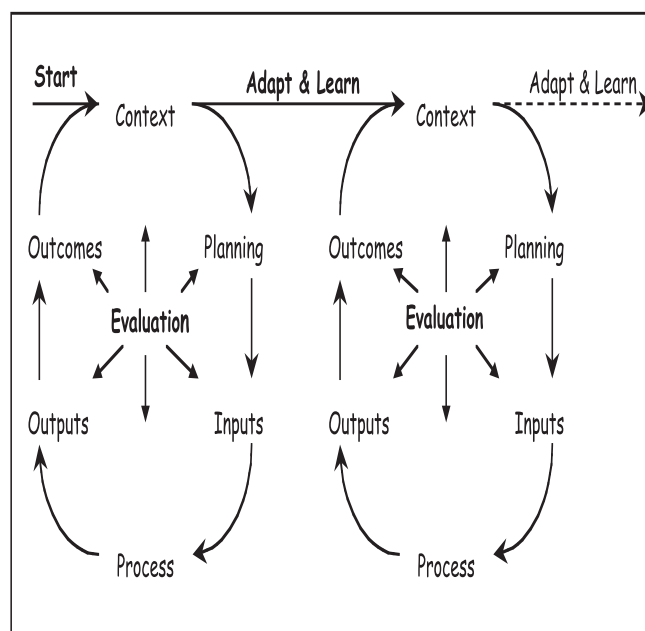

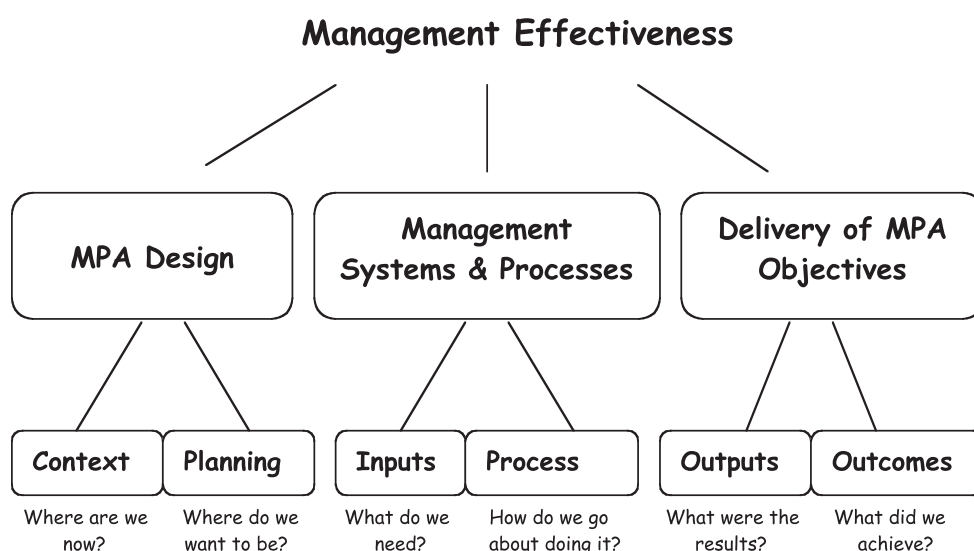

Figure 2. Key components of assessing management effectiveness

1.3 Using the workbook

The Workbook is designed for use in MPAs in the WIO but it is highly recommended that technical advice be sought before starting an assessment to ensure that the methodology and process is fully understood and is adapted to local needs and conditions. It can be adapted to all types of MPAs, whether large or small, community-managed or government run, and whether or not they include both marine and terrestrial components, as is the case with many sites. Before finalising the methodology to be used, it is also important to look at other guidelines and methods that have been developed. A summary of some of the more commonly used guidelines is given in section 2.5.

This methodology uses 'Worksheets' to guide the assessment of each component, the templates for which are provided in Appendix 1.A-U. It encourages basic standards for assessment and reporting, and gives suggestions for issues to be measured, and some ideas for indicators. Thus, like the framework methodology (Hockings *et al.*, 2000a), it provides a common structure and 'language' but allows sites to develop their own indicators or criteria. The scale and detail of an assessment will vary, depending on the financial and human resources available and the particular needs of an MPA. It may not be necessary to monitor all aspects of the environment and management process to determine how effectively an MPA is being managed but an attempt should be made to address all components. Examples of worksheets completed during the pilot assessments are given in Appendix 3.

An effort should be made to repeat the assessment after a period of time (e.g. 3-5 years), and subsequently at regular intervals, to determine improvements and to ensure that the adaptive management approach is indeed being used. The timing and frequency of these assessments will vary depending on the complexity of

the MPA, the resources available, the actions/strategies being implemented at the site and the ability of staff to respond to recommendations and adapt management appropriately. Combining assessments with revisions of the management plans is recommended.

Managing an MPA is similar in principle to managing many activities in our daily lives. We often assess these, in order to do something better or more efficiently a second time. For example, if we are making a journey by bus from Nairobi to Mombasa, or Durban to Johannesburg, we might well assess the various options in order to choose the one that is most suitable for our needs. In this analogy, we can equate the six components of management with the same components of the bus journey:

Context: We need to establish some basic facts about the journey – the state of the road, have some buses got more clearly defined destinations (i.e. objectives and targets) than others? Are there any major obstacles along the way that need to be avoided or overcome?

Planning: Is there a good road map? Are there different routes we can take, and if so which is the right one for us? Is the bus the right size for the number of passengers and luggage it will take?

Inputs: Does the bus have enough fuel, trained staff, and all the equipment needed (e.g. spare tyre, refreshments ...) to reach its destination in the most efficient way?

Outputs: The immediate results of the journey would be the number of people and goods carried, the ticket revenue, the time taken.

Delivery of outcomes: For a bus journey this might be whether the bus reached the correct destination at the correct time and the extent of satisfaction of the passengers.

Does your MPA look like this?

Messy or

Organised

2. HOW TO CARRY OUT AN ASSESSMENT

There is no single 'right way' to carry out an assessment, although there are general principles that apply in all cases (Box 1). The method in this Workbook involves filling out a series of Worksheets (Appendix 1A-T) using primarily existing information about an MPA. The method is flexible and the worksheets can be adapted to different needs and circumstances at individual MPAs.

2.1 Key steps involved

There are a number of key steps in an assessment (Fig. 3). These do not have to be undertaken chronologically, but need to be well coordinated so that they feed into each other. The assessment does not have to be led by a single individual or organisation. Different people or individuals may take the lead at different stages, such as technical MPA staff, independent consultants, or a team specifically set up by the MPA.

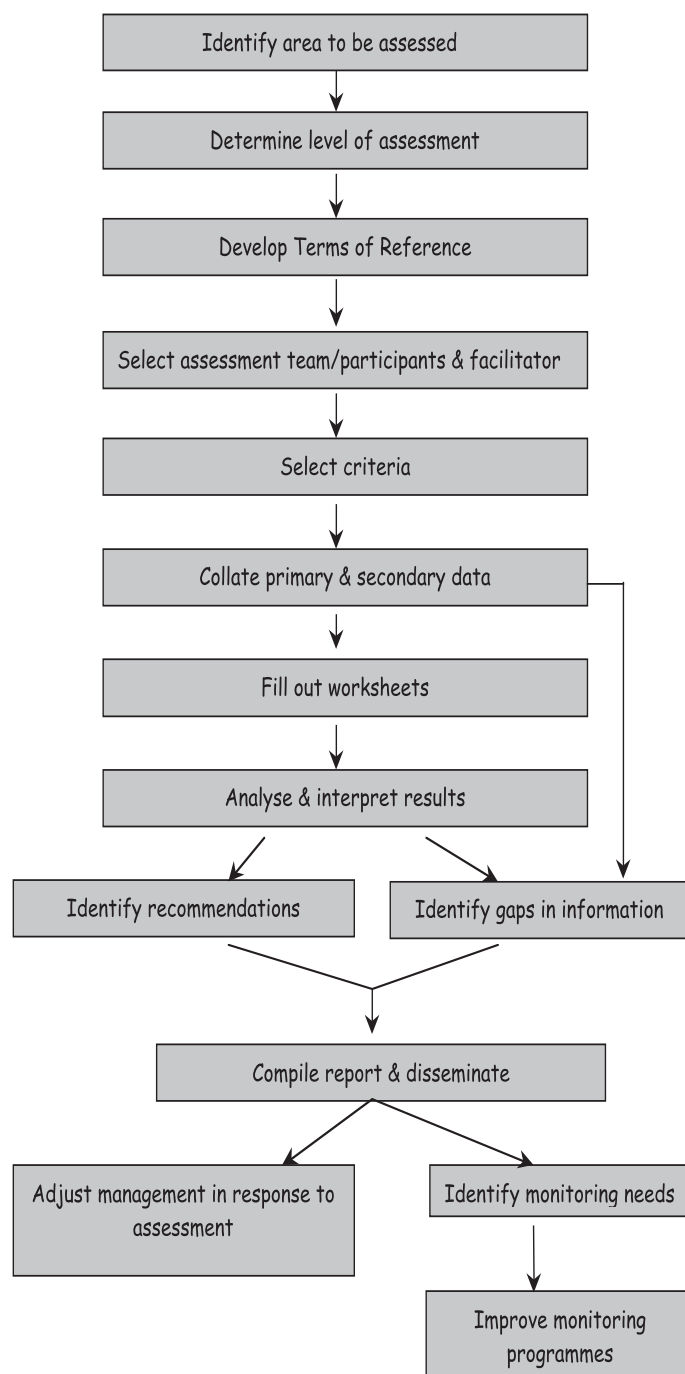

The worksheets are best completed with input from a range of stakeholders through a workshop or a series of consultative meetings. The MPA manager or a consultant can do the initial drafting but sheets should be completed in a group situation. All involved in an assessment must understand that its primary purpose is to improve management, and so they must be willing to talk about problem areas and things that are difficult. If these are covered up or omitted, the assessment will be incomplete and management interventions may not be effective. The person or organisation leading the assessment will need to maintain the quality of the information being collected, and ensure all relevant staff and stakeholders are provided the opportunity to contribute.

As pilot testing has revealed, some stakeholder groups find the worksheets too complex to understand. A questionnaire based on key worksheets has therefore been produced to ensure stakeholder involvement in such circumstances (Appendix 2).

At least two workshops or meetings will probably be needed in the course of the assessment – one with managers and those closely involved in the management of the MPA (e.g. management committee, Board, etc) and one for stakeholders. There will probably also be a need for other smaller meetings, e.g. with scientists working with the MPA. The consultation process will vary according to how the MPA is structured and run.

If systems are already in place that achieve the same purpose as some of the worksheets or components of the assessment, make use of these – it is not necessary to duplicate work. For example, in Tanzania, the Marine Parks and Reserves Unit has a system for reporting annual progress which can be adapted to provide the worksheet for assessing outputs.

Figure 3. Key steps in assessing the management effectiveness of MPAs

Note: A number of the steps can be done in parallel, rather than sequentially as shown above.

The steps involved in undertaking an assessment (Fig. 3) are as follows:

- **Determine level of assessment** - This will vary between sites depending on human and financial resources available, and the specific needs of the site (see section 2.3). At least some level of assessment should be undertaken on outcomes, because this tells you if management is having an impact on the values and objectives for which the MPA was established, and where current or future monitoring efforts may need to be directed.
- **Develop Terms of Reference (TOR) for the assessment** - These should clearly state who will be involved, timeline for the assessment, structure of the final report, and the mechanisms for incorporating the results into the MPA management system and for their dissemination. Processes for including stakeholders in the assessment should be detailed (e.g. questionnaires, interviews, public meetings, field visits, participation in assessment workshop). The assessment team (see below) may need to be identified before the TOR are finalised, so it can have an input into these.
- **Identify assessment team, participants and focal person/facilitator** - A core team should be identified to lead the assessment. This might include MPA technical staff, key stakeholders, consultants or a combination of these, the main criterion being that these individuals are very familiar with the site. It is important to identify the right facilitator to guide the assessment, as this person must be impartial and not be seen to take sides or influence the assessment process. The pros and cons of using an internal (i.e. person working at the MPA) or external facilitator should be carefully weighed; the latter may be able to bring a more objective viewpoint to the assessment. The facilitator will need to become familiar with the assessment methodology, MPA staff and stakeholder representatives before starting the process and preferably someone with previous expertise in this field should be chosen.
- **Select criteria** – Generic criteria against which MPA management effectiveness can be assessed are provided in this Workbook and are discussed in section 2.2. These can be used as they are, or can be adapted to suit the local conditions at the site. Selected members of the assessment team, preferably including someone familiar with the assessment methodology, should be involved in making any necessary modifications before the assessment starts.
- **Collate primary and secondary data** – It is important to consider carefully how the data will be collected and made available. For example, if information about the MPA is scattered, one of the team members or a consultant may have to spend time collating and summarising it. This in itself is a useful output of the assessment process, and could be presented at a meeting where the worksheets could be filled in. Section 2.4 lists types or sources of information that may be useful (e.g. reports, workshops, interviews).
- **Fill out the worksheets** - This can be done in workshops with the MPA staff and stakeholders, and/or consultants. Ideally all stakeholders should have an opportunity to contribute to the worksheets if they so wish. The questionnaire can be used with groups that might have difficulty interpreting the worksheets. It is probably best used in a workshop situation, with MPA staff or other experts present who can assist with the process, but it can also be used as part of individual interviews or simply given to individual stakeholders for completion. The implementation team must then transfer the results of the questionnaires to the worksheets. If the worksheets are completed in an electronic format, teams will be able to analyse their data quickly and improve the sharing and accessing of information.
- **Analyse and interpret results** - The completed worksheets are then analysed, summarised and interpreted by the group(s). It is important that all the stakeholder groups contribute to this step, providing their own perspective and insight into the data interpretation.
- **Identify recommendations and gaps** - Clear recommendations should be made for each of the components assessed, and gaps and monitoring needs should be identified. For management to be considered adaptive recommendations should be prioritised and, where possible, a management agency and/or stakeholder should be identified to implement each recommendation.
- **Compile report and disseminate to stakeholders** - The report should be compiled and disseminated as soon as practical following the completion of the assessment. It should be made available to all staff and key decision makers in the agency and to all stakeholders, including communities, government agencies, private sector, etc as will have been identified in the assessment itself. This will enable recommendations to be followed up and adjustments to be made to management. It may be necessary to simplify or translate the assessment report into local languages for a wider distribution to stakeholders.

- **After the assessment** – Management should be modified according to recommendations resulting from the assessment process. Mechanisms to ensure that recommendations are implemented, within appropriate timeframes, should be built into management processes. This will help to ensure that the assessment does not become a waste of time and resources.

Box 1. General guidelines for assessing MPA Management Effectiveness. Modified from Hockings *et al.* (2000).

- Assessments should be participatory at all stages, and should include all interested stakeholders who have a genuine and demonstrated interest in the management and/or use of the MPA. This ensures the quality and credibility of the results, and may generate support for future management activities.
- Assessments should be open and transparent. The findings should be readily accessible to all interested parties in a way that is appropriate to their needs. This may require translation of written materials into local languages.
- The management objectives and criteria for judging performance should be clearly defined and understood by all involved in the assessment.
- Assessments of management effectiveness should focus on the most important issues (including threats and opportunities) affecting or potentially affecting the achievement of management objectives.
- Consideration should be given to the range of factors (i.e. context, planning, inputs, process, outputs and outcomes) that contribute to management. Outcome-based evaluations are particularly meaningful for assessing the overall management effectiveness of MPAs.
- Criteria for assessment should relate to social, environmental and management issues, both within and outside the boundaries of the MPA.
- Assessments should be based on good biophysical and socioeconomic science; both qualitative and quantitative data may be used but in either case methods should be rigorous and replicable, and result in sound data and evidence.
- Clear recommendations for improving management should be given in the final report, including prioritisation of conservation and management efforts needed; these should be fed back into decision-making processes for the MPA to ensure that management is improved.
- The final assessment report should identify strengths and weaknesses, and should divide issues between those that are within and outside an MPA manager's control.
- Critical gaps in information and any limitations in the assessment should be clearly identified in the final report.
- Assessments should be carried out on a periodic basis to show change over time (hopefully an improvement in management effectiveness).

2.2 Criteria for assessment

As it is not possible, practical or necessary to monitor and assess everything that takes place in an MPA, this method involves selecting criteria, based on the natural, social and cultural values of the area, against which management effectiveness is assessed.

Generic criteria for each component of the management cycle are given in chapter 3 with suggestions as to the type of information needed for their assessment. Criteria might be '**level of government support for the MPA**', or '**level of stakeholder involvement**'. Note that the criteria are generic: some may not be relevant in certain sites; others may need modification to suit the specific biophysical and socio-cultural environment of an MPA; or additional criteria may be necessary.

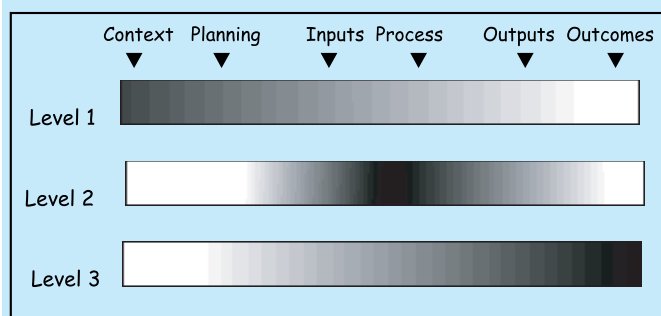

2.3 How detailed should the assessment be?

The scale and type of assessment will depend on the needs of the MPA, as well as its financial and human resources. WCPA has proposed three levels or approaches to assessment, each requiring different amounts of data collection and financial input (Box 2).

- **Level 1** – This type of assessment makes use of readily available information, and focuses on the context of the MPA along with the appropriateness of planning, inputs and processes of management. It relies largely on literature research, informed opinions of site managers and/or independent assessors, takes a short period of time and costs little. Issues are broadly covered, but depth of analysis is generally low. This approach is often useful for prioritisation of issues and improving management itself, but tells you little about the achievement of management objectives.
- **Level 2** – This uses the approach taken in Level 1 but additional data are collected to assess outputs and outcomes. It will therefore take rather longer, cost more and result in greater detail than Level 1. The method in this Workbook reflects this level.
- **Level 3** – This is a detailed analysis of all components of the management cycle. Level 3 assessments thus take longer, but will give more detailed information on which to base recommendations for adaptive management. This approach allows you to determine whether you have achieved the management objectives for your MPA. This level

requires significantly more time and funding. To carry out an assessment at this level of detail, the MPA ideally should have a management plan, baseline data (a benchmark) at the time that it was established, and have been in operation for a period of time (2 years is suggested).

Box 2. Three levels of assessment for measuring MPA management effectiveness; darker shading indicates the main focus of the assessment. Source: Hockings *et al.* (2000).

2.4 Data gathering for the assessment

The types of information needed for each of the six components of the management cycle and suggestions as to how this information can be obtained are given in the relevant sections in chapter 3. The following is a general list of useful sources:

- The proposal or justification for designation of the MPA,
- Management plan, annual and other work plans,
- Annual or other reports to the management agency, donors etc.,
- Administration documentation – financial (budgets, statements) personnel lists, equipment inventories and maintenance schedules,
- Patrol logbooks,
- Technical and scientific reports, surveys & inventories,
- Results of monitoring programmes,
- Legislation and policy documents,
- Mid-term reviews and evaluations of donor-funded projects,
- Interviews with MPA personnel and stakeholders,
- Workshops and meetings convened specifically for the assessment e.g. to compile the threat assessment worksheet etc. These may be for stakeholders, for MPA personnel in general, for manager level, for researchers and scientists, for local communities,
- Other general literature.

It is important to make good use of all existing sources of information. This means that MPA data, reports and other forms of information should be carefully stored and filed in a way that makes them accessible for assessments.

When extracting information, make sure that you record the source or 'reference' so readers and others using the assessment results later will know where the information came from. It is also important to distinguish between **quantitative data**, **qualitative information** and **opinion**. All will play an important role in an assessment but the interpretation may differ according to the sources.

Quantitative data are collected through a monitoring programme or as part of a research study, and in most instances are numerical. Monitoring programmes involve the collection of data at regular intervals to allow comparison over time (see section 3.6.5). An example of a monitoring programme is the measurement of coral cover and fish species abundance at regular intervals to determine changes in coral reef health. Research studies may or may not include monitoring, but ecological research usually involves the collection of quantitative data, using statistically sound methods, so that if required the study can be repeated and the same results obtained. Both monitoring programmes and research studies should be carefully designed to allow accurate interpretation of the results and statistical analysis if necessary.

Qualitative information can be obtained from a wide range of sources, and is descriptive rather than numerical. In some cases (e.g. presence/absence data) it will be verifiable but in other cases it will be subjective, and its validity may be dependent on the observations and interpretation skills of the recorder.

Useful qualitative data for an assessment might include whale sightings, observations of unusual events, or descriptive material about a site that helps to show changes over time.

Opinion and perception – it is very important to obtain the opinions and perceptions of stakeholders and MPA personnel about management of the MPA. These will vary according to the interests, experiences, and other characteristics of the individual providing the information. This is why it is important to ensure that the worksheets are preferably completed as a group exercise and that they are then reviewed by a wide range of stakeholders. For example, an assessment at Kisite Marine Park in Kenya, showed that although MPA personnel thought that local fishers did not support the MPA, the fishers in fact had considerable respect for the role that it plays.

It is also important to distinguish between information that has been collected over a **long time period** and that thus reflects trends in an issue or a very permanent situation; and information that has been collected at a **single point** in time and that may reflect only the status of a parameter at that point. For many of the worksheets it is therefore important to note the **period** over which data were available. This is particularly important for the worksheets on **outputs** (e.g. if the numbers of visitors to the MPA is an indicator, it is important to provide both the actual numbers and the years/months/weeks that the figures relate to) and on **outcomes** (e.g. if turtle populations are an indicator, and the results of a monitoring programme are presented, the dates when the information was collected should be given).

There are a variety of ways to obtain and present the information for an assessment. Some issues are best assessed using a simple descriptive, or qualitative, format. For others, it is possible to develop ranking or numerical rating systems (i.e. a semi-quantitative approach), and in some cases a quantitative method, using data collected through a monitoring programme, may be possible. Depending on how rigorous the method is, comparisons between repeated assessments should be possible.

2.5 Other resources and methodologies

This Workbook is only one of a number of tools now available to assist protected areas in assessing their management effectiveness. The following may be particularly useful:

Score Card to assess progress in achieving management effectiveness goals for MPAs.

The World Bank has developed a 'Score Card' which permits a relatively quick and inexpensive overview of the progress made in an MPA, and can be completed in a single meeting of staff and stakeholders, if reference materials and resources are readily available (Staub and Hatzios, 2003). It is considered a level 1 assessment (see section 2.3) and as such focuses more on the context of an MPA, planning, inputs and processes of management, rather than outputs or outcomes. While this is a useful tool for tracking how well an MPA is progressing, it should not replace more rigorous methods of assessing management effectiveness that can guide adaptive management. The Score Card is available online www.mpascorecard.net

How is your MPA doing? A guidebook of natural and social indicators for evaluating MPA management effectiveness.

This guidebook, by WCPA-Marine, is largely oriented to outputs and outcomes and focuses on the development and use of indicators for these two components of an assessment (Pomeroy *et al.*, 2004). Outcomes are divided into three categories - biophysical, socioeconomic and governance, and performance indicators are provided for goals and objectives listed under each category.

It should be noted here that the term 'criterion' is used in this methodology in a similar way to the term 'indicator' in the WCPA-Marine methodology. Many of the criteria used here are similar or identical to indicators proposed by WCPA-Marine. As these two methodologies are tested further, it should become possible to harmonise the terminology as well as the indicators/criteria themselves.

The World Heritage management effectiveness workbook

This workbook has been developed as part of the four-year UNESCO/IUCN Project to develop and test a method for assessing management effectiveness of World Heritage Sites (Hockings *et al.*, 2004). It covers all components of the management cycle and can be considered a level 2 assessment, involving the collection of data to assess outputs and outcomes. The workbook for MPAs in the WIO is based on this approach, and uses adaptations of the worksheets designed for World Heritage Sites.

3. THE WORKSHEETS

In this chapter, a general explanation of the worksheets is given for each of the six components of the management cycle. Templates for the worksheets are provided in Appendix 1. Sample completed worksheets are given in Appendix 3. Table 1 shows the worksheets suggested for each of the assessment components, but it should be noted that not all of them will be relevant to every MPA.

The worksheet templates can be downloaded as excel spreadsheets from the website www.wiomsa.org. This is recommended, as the spreadsheet format will facilitate the compilation of the worksheets and any amendments that are required during the consultation process. It is also recommended that an overview worksheet (Appendix 1.A) is completed to ensure that the basic data about the MPA is recorded, as well as information about the assessment itself.

Table 1. Worksheets for the assessment

Assessment component	Worksheets	Appendix
	MPA Overview	1.A
Context	Management Targets	1.B
	Threats (Sources and Stresses)	1.C
	Review of National Context	1.D
	Assessment of Stakeholder Engagement	1.E
	Stakeholder Engagement Summary	1.F
Planning	List of Planning Documents	1.G
	Adequacy of Management Plan (and other plans if relevant)	1.H
	Design Assessment	1.I
Inputs	Assessment of Resources (Inputs)	1.J
	Resources (Inputs) Summary	1.K
	Qualitative Assessment of Inputs	1.L
	Assessment of Capacity	1.M
Process	Assessment of Management Processes	1.N
Outputs	Assessment of Management Plan Implementation	1.O
	Management Plan Implementation Summary	1.P
Outcomes	Assessment of Biodiversity (and other Natural Values)	1.Q
	Objectives	
	Assessment of Socio-economic and Cultural Objectives	1.R
	Ranking of Current Threats (Stresses and Sources)	1.S
	Current Threat-Target Summary	1.T

3.1 Context

The review of **context** looks at the biological, social, cultural and economic values of an MPA, its current status, threats, and vulnerability, as well as factors that may appear external to the MPA but which are very important, such as the legislative framework and policy environment that govern its management. When assessing context, we are asking **where are we now?** A context review is not an analysis of management as

such, but understanding the context of an MPA is fundamental to making wise management decisions that are relevant, applicable to the local situation and most needed.

It is useful to complete the context review first because it provides the background for determining the level of detail required for the assessment. It uses existing qualitative information and can be done relatively quickly. Four sets of criteria are used:

- Significance & Values
- Threats
- National Context
- Engagement of Stakeholders

3.1.1. Significance and values

Fundamental to the assessment is a good understanding of why the MPA was set up. What is its significance and what are its key values? Was it established because of large populations of nesting marine turtles? Or because of rich coral reefs or because there are known fish nursery areas? Such key parameters are referred to in this method as **Management Targets**, as they are the important attributes or **values** management will largely focus on.

A first step in an assessment is to define the MPA values - i.e. the key attributes for which the MPA was established and why it is locally, nationally, or globally important. Values can be divided into three types (Table 2):

- **Biodiversity** values: e.g. unique or threatened species or ecosystems, biological diversity;
- Other **natural** values such as geological or representative ecological processes; and
- **Socio-economic and cultural** values.

Information on the values of an MPA will be found in the proposals and reports that were used to establish the MPA, in the management plan if there is one, through interviews with experts and stakeholders and scientific data studies and reports – from satellite imagery to site-specific biological inventories and rapid ecological surveys. Using this information, a values table can be assembled. This list may include other key attributes that were not specifically noted or known when the MPA was first gazetted.

An MPA will have many values and it would be difficult to assess the extent to which all are being maintained effectively. In this method, it is suggested that a few key values – referred to as **management targets** - are selected for the assessment.

Table 2. Examples of values of MPAs

Biodiversity values	Other natural values	Socio-economic & cultural values
<ul style="list-style-type: none"> ▪ Endemic threatened or non-threatened species; ▪ Globally threatened species on the IUCN Red List; ▪ Regionally (e.g. listed on the Nairobi Convention) or nationally threatened species; ▪ Habitats and ecosystems unique to the country; ▪ Habitats and ecosystems for which the country holds a significant portion of the world total. ▪ Critical areas (e.g. feeding, nesting or breeding grounds) for the life-cycle of threatened species; ▪ Species-rich habitats & ecosystems; ▪ Nationally representative habitats & ecosystems 	Significant geological features may include: <ul style="list-style-type: none"> ▪ raised atoll; ▪ seamount; ▪ unique landscapes and features; ▪ specific reef formations; ▪ parabolic dune systems; ▪ transition zones for particular habitats; ▪ coastal barrier lakes; ▪ island ecosystems; ▪ offshore banks. 	Cultural values may include: <ul style="list-style-type: none"> ▪ traditional fishing grounds; ▪ sacred sites or species; ▪ archaeological sites ▪ historical area or event
	Significant ecological processes may include: <ul style="list-style-type: none"> ▪ convergence zones for major oceanic currents; ▪ upwelling areas; ▪ source areas for recruitment. 	Socio-economic values may include: <ul style="list-style-type: none"> ▪ improved livelihoods ▪ sustainable fisheries ▪ education ▪ research ▪ tourism and recreation ▪ aesthetics.

Recommended process to define targets

Management targets should, as far as possible, capture all the biological, social and cultural values but be limited in number so that they can be acted on efficiently and reflect the management capacity at the MPA.

The management targets should closely reflect the objectives of the MPA. The objectives are often very generally worded. The selection of management targets helps to ensure that the objectives are fully understood and that management is directed towards their achievement. For example, if there is an objective to 'protect biodiversity' at least some of the management targets should be biodiversity ones; if there is an objective to 'promote environmental education', at least one of the management targets should be related to environmental education.

Where there are good baseline data for an MPA and capacity for detailed monitoring programmes, it may be possible to set a numerical or quantitative target. For example, one of the management objectives for Cousin Island Special Reserve in Seychelles is "To maintain viable populations of endemic land birds, and internationally important breeding seabird population on the island". The birds are well studied and so it was possible to set the following management targets:

- Maintain viable population of Seychelles Warbler at over 300
- Maintain viable population of Seychelles Fody at over 1000
- Maintain viable population of Seychelles Magpie-robin at over 25
- Maintain breeding seabird population at current level

However, if this is not possible, descriptive qualitative targets should be set.

The template for the worksheet (Appendix 1.B) has one column for the MPA's and objectives are for the management targets. There is also a column to explain why each management target has been chosen (i.e. the values of the MPA that relate to that target) and a column to identify the extent to which information on each target is available (this is useful when outcomes are assessed). Examples of values of MPAs are given in Table 2. An example of a completed Management Targets Worksheet is given in Appendix 3.A. **Once the management targets have been defined, the same list should be used for other worksheets (e.g. assessment of threats, assessment of outcomes).**

3.1.2 Identifying threats – stresses and sources

Threats to the MPA must be identified correctly, so that resources are appropriately used. For example if destructive fishing is not a threat to an MPA, spending resources on raising the level of awareness about this issue will not be useful. Some threats may be difficult for the manager to address, particularly those coming from outside the MPA (e.g. fishing outside the boundary, poor catchment management, or pollution resulting from shipping, urban run-off, sewage discharge etc), and it is useful for the manager to know about these.

Threats to MPAs are often multiple with complex causes and consequences which need to be well understood for an effective assessment. There are two parts to a threat:

- the **stress(es)** to the management target and
- the **source(s)** of each stress.

'Stresses' are the types of destruction or degradation affecting the MPA, such as sedimentation, loss of coral or mangrove habitat, or alteration of age structure in the populations of a species. **Note that these are problems with the ecology or function of the management target, not the human activity itself.**

'Sources' are the natural events or human activities that cause the stress. For example, conversion of forests in a watershed to agricultural land (source) causes sedimentation (stress) to a river and adjacent coastal ecosystems. Similarly, the killing of sea turtles and the consumption of their eggs (sources) alter the age structure or reduce reproductive output (stresses) of a turtle population.

Separating **stresses** and their **sources** is important for several reasons:

- 1) By examining stresses caused by human activity, we can more carefully analyse the effects such practices have on the ecology and long-term integrity of the management targets. For example, simply stating "deforestation of mangroves" as a threat fails to highlight the various problems such as loss of habitat, increased sedimentation, and reduction in fish/invertebrate nursery areas that affects a site's management targets.
- 2) Separating stresses and sources can help managers to find more precise strategies and interventions to remove the sources. If the sources cannot be eliminated, it may be possible to take action to reduce their negative impact/s, to ensure that MPA values can persist in the presence of continuing human use.
- 3) Because sources can create multiple stresses, the separate identification and assessment of these stresses enables site managers to prioritise their management activities to address those sources that cause most damage. Management efforts should focus on the most critical stress-source combinations that have the greatest negative impact on the management targets at an MPA.

When filling out the worksheet, (Appendix 1.C) all stresses that impair the integrity of each management target should be identified and listed in column 2. Column 3 is used to give a qualitative description of their severity. This list should be based on an understanding of what that target needs to persist in the long-term. For example, a coral reef may need appropriate pH, turbidity and nutrient levels, controlled rates of harvesting of fish and invertebrates, and connectivity with adjacent source reef areas to function adequately. All sources of each stress are then

listed in column 4, with a qualitative description of the extent to which they actually cause the stress in column 5. In column 6 it should be noted whether the 'source' is a regular or continuing event, or an occasional one. This is important to note since some threats may result in continuous low level stress to a species or habitat (e.g. disturbance of wildlife by visitors) whereas others may cause a high level of damage but occur only very rarely (e.g. an oil spill). Existing documents and reports, such as management plans and proposals for the MPA, as well as workshops and meetings, should be used to obtain the information.

Some threats may be external and beyond the control of individual managers, (e.g., air pollution, climate change or poor watershed management) but nevertheless should be listed.

Table 3 provides an example of a completed threats worksheet, illustrating a management target (corals) affected by more than one stress, and a stress (low visitor numbers) caused by more than one source. This example also shows the importance of ensuring careful alignment of the horizontal rows, so that sources are lined up against the relevant stresses.

Equally, in addition to considering current threats, it is important to consider potential threats i.e. sources of stress that are not currently taking place but which are on the horizon and that may significantly affect the integrity of an MPA and have important implications for management.

For example, an MPA might be located on or adjacent to a natural gas or oil field; if exploitation of this resource has not started, the threat from this activity would be only 'potential'. Similarly, there may be a proposal for the development of a large aquaculture facility adjacent to an MPA, which could have major implications for water quality in the MPA. We are often

Table 3. Sample completed threats worksheet

Management target	Stresses	Severity of stress	Source	Relative contribution of source to stress	Regular or occasional threat
Coral reef fish	Decline in fish abundance	Low in Park and Reserve but potential for increase in Reserve	Overfishing	Main cause of fish decline	Regular (daily, but increases in NE monsoon)
Corals	Bleaching	High in localised areas	Global warming	Main source	Occasional (1982, 1998)
	Broken corals	Medium in localised areas	Anchoring of boats	Small contribution	Regular (3-4 times/week)
Ecotourism	Low visitor numbers	Varies seasonally and with socio-political situation	National travel bans for foreigners	High contribution in 2003	Occasional (but not predictable)
			Competition with better known, more accessible MPAs	Low level all the time	Ongoing

in a position to predict potential threats and so their identification should be part of the assessment. A list of potential threats can be drawn up by considering social, political, cultural, legal and demographic trends at the site. The likelihood of their occurrence should be weighed against the need for management action.

Assessment of potential threats can lead to much discussion of issues that may not be a high priority for current management. These should therefore only be included where they clearly add value to the assessment, and it should be clearly noted that they are potential, not existing, threats. Efforts should focus on current threats or those likely to become a problem or cause concern for the MPA within the next 5 to 10 years. Focus on 'real' threats e.g. if there is nothing in the area to cause air pollution, do not list this as a threat.

3.1.3 Review of national context

Five criteria have been identified to assist with this part of the assessment: **legislation, government policy, international conservation conventions, government support and the relationship between the MPA and the national protected area agency.** The worksheet (Appendix 1.D) involves a qualitative review of the strengths and weaknesses of each, using questions to guide the assessment.

National legislation, such as that for fisheries, must be fully understood, as much of this will be applicable within the MPA, in addition to specific MPA regulations. It is similarly important to understand relevant national policies and the extent to which they are supportive of management approaches that are being taken in or proposed for an MPA. For example, in Tanzania, the participatory approach is fundamental to natural resource management policy (and is enshrined in the MPA legislation) whereas this approach is in the early stages of being introduced in Kenya. National-level policies can thus have a big impact on the effectiveness of an MPA and the ability of a manager or stakeholders to influence management processes. It is also useful to know whether the government is supportive of an MPA and the degree to which legislation is helping to maintain MPA values.

The assessment of the criterion relating to international conventions provides an opportunity for MPA personnel and stakeholders to learn about and understand their relevance. Some guidance for assessment of this criterion is given in Appendix 4. It is recommended that only

those treaties and agreements directly relevant to the MPA are considered; it is not necessary to review all environmental conventions.

The review is best carried out at a workshop, preferably with knowledgeable representatives from the national protected area agency, the necessary data having been collected earlier. Information sources will include copies of legislation, the management plan and a range of general literature and reports.

An example of a completed Review of National Context Worksheet is given in Appendix 3.B.

3.1.4 Engagement of stakeholders

Effective management almost always requires strategic partnerships and engagement with the individuals, groups or organisations who influence an MPA's values and/or are dependent on an MPA's resources. Stakeholders can be defined as the **'people, groups, communities and organisations who use and depend on the MPA, whose activities affect it, or who have an interest in these activities, including government agencies, NGOs, local users, universities and researchers'.**

The identification of the stakeholders and partners, an understanding of their relationship to an MPA and its resources, and consideration of their level of engagement in the MPA, particularly in regard to management, are important parts of the context review. The worksheet helps to identify who uses the area, who will benefit from its protection, and who can assist with management. It should also consider whether the current partners involved in management are appropriate, and whether others should be involved.

This part of the assessment can be undertaken for the MPA as a whole, or for each management target depending on the size and complexity of the MPA and the number of stakeholders:

- In most cases, it is probably adequate to do a single stakeholder engagement worksheet Appendix 1.E for the MPA as a whole. In this case, the summary worksheet Appendix 1.F is not needed.
- For larger, more complex MPAs with plenty of experience, stakeholder engagement can be assessed for **each management target**. The reason for this is that different stakeholder groups may have different levels of engagement with different management targets. The results are summarised in the summary worksheet and scored for each target and each stakeholder. This gives an overall rating for the engagement of stakeholders.

The first step is to identify the main stakeholder groups. This will have been done in some cases when the management plan was prepared or the MPA first established. In other cases, it may be necessary to do this as part of the assessment. Once this has been done, the worksheet suggests that stakeholder engagement is assessed in several ways as follows:

Relationship of stakeholders to an MPA

- **Economic dependency:** How and to what degree are the stakeholders dependent on a management target for their economic well-being?
- **Negative and positive impacts:** What is the nature and extent of the negative and positive impacts of a stakeholder on a management target?
- **Willingness to engage:** How do the stakeholders participate in management of a management target? Under what terms or conditions are they willing to participate?
- **Political/social influence:** What political or cultural leverage or influence do stakeholders have in the management of a management target?
- **Organisation of stakeholders:** How and to what degree are stakeholder groups organised in relation to the management of the MPA?

Involvement of stakeholders in management

- **Opportunities to contribute to management:** Describe the nature and extent to which stakeholders contribute to decision-making and their level of authority. This includes both formal opportunities (e.g. representation on Advisory Committees, assisting with enforcement and collection of fees) and more informal opportunities (e.g. local people providing guiding services for visitors, hoteliers providing facilities for MPA meetings and workshops)
- **Level of stakeholder engagement:** Describe the actual engagement of stakeholders/partners in the management of a specific management target.

The worksheet should preferably be completed during a group meeting of the stakeholders. The questionnaire (Appendix 2) will be particularly useful for this component of the assessment in some situations, for example with local fishers.

On the completed worksheets, make sure that an explanation is provided for the judgments that are made. An example of a completed worksheet is given in Appendix 3.C.

3.2 Planning

The component on **Planning** focuses on **where do we want to be and how are we going to get there?** There are two main criteria for assessing Planning:

- i. status and adequacy of management plans and other types of plan; and
- ii. adequacy of the design of the MPA in relation to the management targets and MPA capacity

3.2.1. Adequacy of management and other plans

The first step is to identify the key planning documents that have been developed for the MPA, such as an overall management plan, strategic plans, zoning plans, and specific functional plans (e.g. fire plan, tourism plan). These can be listed on the first worksheet provided for this section (Appendix 1.G).

For sites with an overall management plan, four principles are used for the assessment:

1. The plan should provide a good decision-making framework

This requires: (i) a clear vision of the desired future for the MPA; (ii) a set of strategies and actions, but also flexibility so that these can be adjusted as circumstances change over the life of the plan; (iii) clear guidance that can assist managers in dealing with issues and opportunities that arise during the life of the plan; and (iv) a basis for monitoring the implementation of the plan as well as progress towards the desired future.

2. The plan should be appropriate given the context of the MPA

It should place the management of the MPA in the relevant environmental, social and economic contexts. Where possible, planning decisions should be integrated into a broader planning framework.

3. The plan should be adequate in terms of content

The content should be based on adequate and relevant information and address the real needs and interests of relevant stakeholders in relation to the desired future for the MPA.

4. The plan should be designed for effective implementation

It should provide a programmed and prioritised set of actions for achieving the desired future for the area.

The criteria for assessing the extent to which the plan meets the principles listed above are set out in the Adequacy of the MPA Management Plan Worksheet (Appendix 1.H). A qualitative rating system is used. MPA personnel and those who are familiar with the plan and use it regularly should complete this worksheet. An example of a completed worksheet is given in Appendix 3.D. A similar assessment could be carried out for other planning documents for the MPA, if considered appropriate. If there is no management plan, those involved in the assessment should consider whether there are other plans or documents that provide clear and explicit management directions for

the site. If yes, the nature, origin and status of these management directions should be described, using or adapting the principles and criteria listed above.

3.2.2. Adequacy of design of MPA

Evaluating the design of an MPA involves assessing how the decisions that have been made about various factors (its size, location, position of boundaries, zoning, ecological representation, and links/connectivity with other MPAs) affect its later management. An assessment may show that key areas for biodiversity (e.g. nursery or spawning areas or coral reefs that are particularly resilient to coral bleaching) lie just outside the boundaries of the MPA, and it may be feasible to alter these. New threats may also necessitate a change in design – for example, increasing shipping traffic in the vicinity of Aldabra Atoll led to an extension of the shipping exclusion zone around the protected area.

Some design elements (e.g. location, outer boundaries) will have been determined prior to declaration of the MPA and may have been guided by factors other than achievement of the objectives, such as availability of areas for designation, and social, political and economic conditions at the time. An assessment may thus find that an MPA is poorly located, or inappropriate in size or shape to achieve its objectives. For example, many MPAs are probably too small to ensure adequate protection of their management targets. This will often be difficult to alter, but such issues are worth addressing as over time changes can be made. For example, Mozambique increased the size of Bazaruto Archipelago National Park from 600 to 1430 sq km to provide greater protection for its dugong population. When surveys in Moheli Marine Park in the Union of the

Comoros showed that the no-take areas were not appropriately located to protect fish populations, discussions were held with stakeholders and the boundaries changed. Even though many of these factors will have been beyond the control of the people who selected the MPA, it is nevertheless important to understand these limitations for management.

The assessment method examines site design in relation to its impact on ecological integrity (i.e. the biodiversity objectives), community well-being (socio-economic objectives) and the ease of management (governance issues such as legal status, access and boundaries) of the MPA. In each case, qualitative information on the strengths and weaknesses of aspects of MPA design is collected, using a set of guiding notes (Appendix 1.1) to make sure that relevant issues are considered. The assessment can take place at a workshop with input from MPA managers, local community representatives, scientists and other experts. Each component of the worksheet should be discussed and a summary of conclusions recorded. Any issues in dispute should be noted.

Information from this assessment can be used in a number of ways:

- to identify ways in which management effectiveness could be improved through changes to the design;
- where the design cannot be changed, there may be compensatory changes to the way in which the area is managed to ameliorate problems;
- to identify issues where agreements with MPA neighbours may be useful for improving management.

3.3 Inputs

Assessment of **Inputs** focuses on **what do we need** in terms of resources such as staff, funds, equipment and infrastructure. It requires an assessment of resources available and whether use of these resources is optimal. This part of the assessment can help to show where reallocations are needed, if it is found that the current situation does not reflect the priorities identified in the management plan. For example, if the assessment shows that 20% of the budget is allocated to natural resource management, 10% to visitor management, 30% to enforcement and compliance, and 40% to education and awareness activities, but the management plan sets different priorities, adjustments may be required. Realistic estimates of resource needs can also strengthen funding proposals.

Although the concept of an assessment of inputs is relatively simple, it can be difficult to assess needs and adequacy of existing inputs in relation to each objective which is the preferred method. Inputs to an MPA are rarely allocated on a 'functional basis' and indeed this is often difficult to do. For example, a boat might be used for several management activities (patrolling, monitoring, research etc) and it could be difficult to decide what 'proportion' of the boat is used for any one of these. Estimations can be made however, and some project management systems now require this, as it is a very useful approach if feasible.

This part of the assessment should also look at the inputs provided through, or potentially available from, partnerships and collaboration with different stakeholders. In most MPAs in the WIO, no single agency can provide all the necessary inputs and there are often in-kind contributions or other forms of support from stakeholders or partners. These might include a tourist operator providing vessel support for patrols; a local or international NGO providing additional financial resources or staff to support activities such as education and awareness-raising, species conservation, or the development of management plans; or a scientific institution providing technical assistance for carrying out research and monitoring.

This assessment is best done by MPA staff, but the results should be reviewed by other stakeholders. The information required should be available through existing budgeting and reporting systems, and can be found in budgets, financial statements, asset registers, staff profiles etc. The assessment ideally consists of two steps:

- assessing the inputs needed for management
- assessing the adequacy of actual or current inputs available

3.3.1. Assessing staffing requirements and adequacy

The input assessment helps managers to understand whether there is sufficient staff capacity at an MPA to implement tasks outlined in the management plan. An assessment of capacity can lead to more focused training of MPA staff to ensure they have sufficient knowledge and skills to complete tasks allocated to them. For example, monitoring coral reefs and the interpretation of the data requires specialised skills which MPA staff may lack. In this case, a more strategic approach may be to form a partnership with a local research institution. If poor communication between MPA staff and local communities is identified as a problem, there may be a need for training, or exchange visits with an MPA where this is not a problem, or allocating more time to activities such as participation in community meetings.

A worksheet is provided to guide the assessment of capacity. However, since most MPA personnel have posts that cover implementation of more than one target, it may be difficult to assess needs and adequacy in this way. An assessment can be initiated by listing all personnel with information about their skills and training in relation to their jobs, which should be related to the management targets. Strengths, weaknesses and recommendations for improved capacity (through training, moving individuals to positions they are best qualified for etc.) can then be made by comparing the list with the worksheet. For most management targets, a team of people will be required; for example, for protecting turtles, it is necessary to have enforcement staff but also personnel with skills for monitoring, research and perhaps guiding tourists.

3.3.2. Assessing financial inputs

Sometimes the activities in the management plan have been costed and this provides an estimate of the financial inputs required. In other cases, a separate long-term financial plan or business plan is produced; for example both Quirimbas National Park in Mozambique, and Masoala National Park in Madagascar have done business plans. The financial plan is usually for 5-10 years, ideally complementing the management plan. The term 'integrated strategic and financial planning' is sometimes used for the combined process of developing a long-term management and financial plan. A financial plan should show how the finances will be aligned to the MPA objectives, evaluate the costs of operating the MPA, identify potential cost reductions, and ensure that the management plan is feasible. It will also look at the different sources of income, project these and assess the probability of receiving them. Funding sources should be matched with activities according to the type and duration of funding needed. Managing a

newly gazetted MPA is expensive, requiring funds for equipment and infrastructure, baseline assessments, training and research, which may best be met through a donor. Subsequent management costs are lower, involving recurrent operational and administrative support, patrolling, maintenance of equipment, monitoring, community outreach and education.

Although difficult, estimating costs is a key component of the financial planning of the MPA. It should involve administrative staff, technical staff and others involved in conservation activities, and the central management agency. There are two kinds of costs:

Management or programmatic activities (e.g. surveys, monitoring, patrolling). In well-established MPAs, figures for on-going or recurrent activities should be readily available from the accountant. For occasional activities, it is worth looking at previous budgets to see if costs have been estimated before. Quotes should be obtained for new equipment and for work that may need to be contracted out. The cost of the time of the MPA manager and support staff spent on an activity should be factored in, as well as that of those directly involved.

Administration (known as overheads, fixed costs, indirect costs or operating costs), e.g. maintenance of infrastructure and equipment, personnel, and utilities. These costs should be estimated by the administrative personnel, with the manager. Administration (or a certain component of it) is sometimes expressed as a % of the overall budget and it is generally considered reasonable to charge 10-15%.

Further advice on estimating financial inputs is given in Macleod *et al.* (2001), with examples of spreadsheets.

3.3.3. Assessing equipment and infrastructure requirements and adequacy

Most MPAs will have stock inventories which provide the baseline information on what is available. A comparison of such documents against a list of needs identified by looking at the proposed activities in the management plan can provide a good estimate of adequacy of equipment and infrastructure.

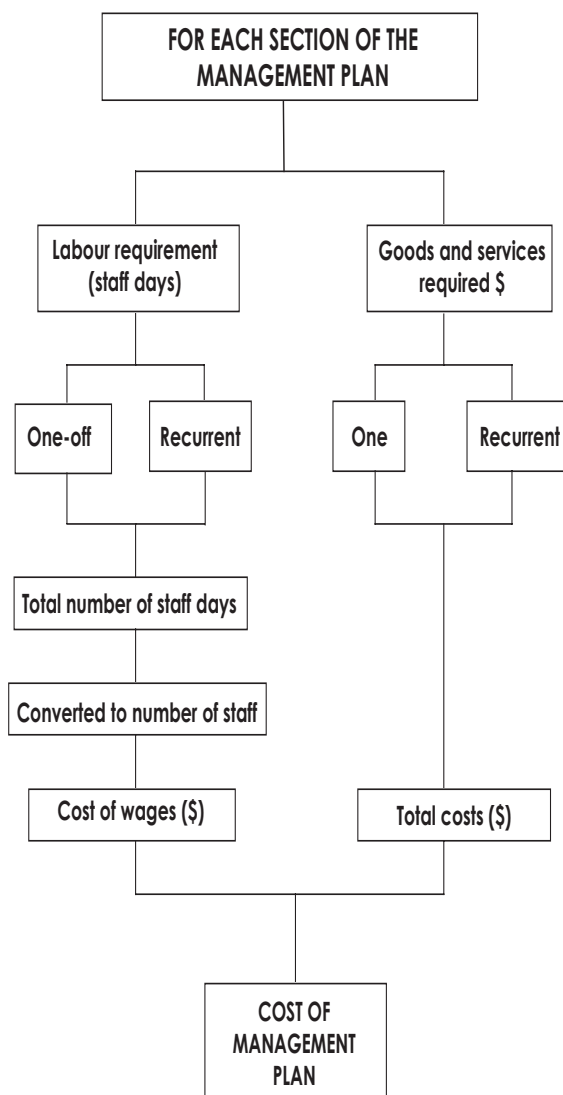

Care should be taken not to overestimate needs. It is tempting to seek the 'biggest and best' of everything, particularly if costs are being met by a donor. For example, the type of boat or vessel required for patrols, research and other aspects of MPA management, and its maintenance cost need careful consideration. Equipment, such as a boat, which cannot be serviced or maintained easily, or which is too costly to look after is not appropriate although a large, fast boat is often what the MPA staff would like! Equally, needs must be realistic.

3.3.4. Summarising input requirements and assessing adequacy

Ideally this would be done in reasonable detail, to provide the basis of a financial strategy. One method is to work out the requirements in terms of staff, equipment, infrastructure and funding for carrying out all the strategies and actions detailed in an MPA management plan. Figure 4 outlines one method of doing this, based on an assessment carried out at a World Heritage Site in Australia. The worksheet (Appendix 1.J) for this, with a summary worksheet (Appendix 1.K), is provided and further information on this approach can be found in the workbook for the World Heritage methodology (Hockings *et al.*, 2004).

These worksheets in particular may need adaptation to the local situation at each MPA. If a detailed financial analysis is not possible, a qualitative assessment can be done, and a worksheet is provided for this in Appendix 1.L

Figure 4. A method for calculating the cost of implementing a management plan. Source: Hockings *et al.* (2000).

When assessing input requirements, it is also important to understand the capacity of MPA staff and their partners and stakeholders to meet their MPA management target. An assessment for this is provided in Appendix 1.N.

3.4 Process

An assessment of management **process** focuses on the question **how do we go about it**, referring to the manner in which management is carried out. It aims to answer the following questions:

- Are the best systems and standards of management being followed, given the context and constraints under which MPA managers are operating?
- Are agreed policies and procedures being followed?
- How and in which areas can management practices be improved?

This assessment involves looking at issues such as day-to-day management, annual work plans, capacity building and communication. It helps to identify whether the staff have the capacity (i.e. skills, knowledge and training) to carry out their designated tasks, how well the management plan or annual work plans are being implemented and the extent to which capacity building and training is needed. It also identifies how well actions in the management plan or yearly work plans are being implemented and why particular tasks were not completed. For example, perhaps managers and their staff were too ambitious, or lacked capacity to complete different tasks, or priorities changed, inadequate funds were allocated, or the local situation changed.

The worksheet can be used as it is, assessing performance against the generic standards proposed. However, if there are sufficient time and resources, this assessment should be used to develop specific standards for best management practices for the MPA. While this may seem a lengthy process, once standards are developed they can be used and modified in consecutive years in response to management changes.

3.4.1. Developing standards for the MPA

Standards for MPA management are descriptions of the **best management practices** that can be reasonably expected. For example, a standard for visitor management might be "to ensure all visitor facilities are maintained and repaired regularly to ensure visitor safety and enjoyment". Standards should be ambitious,

defining the way management should be conducted in the absence of constraints arising from lack of funding, staff numbers, and staff skills, to allow room for modification and improvement.

The steps involved in identifying standards are:

1. Managers to identify key issues relating to management processes and collect relevant data.
2. Managers' workshop to establish standards. The Worksheet can be used as a guide and adapted as required. Standards should be set in relation to management targets/ objectives as well as agency policies, regional standards, etc.
3. Site meeting to discuss worksheet and agree on final standards with a wide range of stakeholders.

Standards for management can be developed from a number of sources including:

- management agency policies;
- provisions in MPA plans;
- best practice guidelines;
- MPA staff; and
- local partners and stakeholder groups.

It is not necessary or practical to define standards for every aspect of management and priority should be given to those aspects considered to be most important to MPA managers, staff and key partners and stakeholders. Once standards for the MPA have been developed, the worksheet proposed for this assessment can be adapted. IUCN's Ecosystem, Parks and People

project has proposed a draft set of minimum standards for protected areas management in general, which may provide some guidance (Table 4); note that these standards do not represent an "official" consensus, but are the result of a broad series of consultative workshops, including the 5th World Parks Congress in 2003 (Carabias *et al.*, 2004).

3.4.2. Assessing performance against the standards

Standards are generally **qualitative** rather than **quantitative** and it is recommended that for the worksheet (Appendix 1.N) a scale of Very Good, Good, Fair and Poor is used. Thus personnel can rate themselves on how well they have completed their assigned management tasks or how useful training exercises have been, or how well equipment or facilities have been maintained (e.g. Poor = little or no maintenance undertaken, Fair = maintenance only undertaken when repairs needed, Good = most equipment/facilities regularly maintained, Very Good = all equipment/facilities maintained regularly).

For each criterion in the worksheet, just one of the four ratings should be selected. In some cases, points (indicated by +1) are awarded if an additional standard applies to the MPA.

An assessment of management processes should involve as wide a range of stakeholders as possible. Since it involves a very broad review of all aspects of MPA management, it may sometimes it may be appropriate to complete this worksheet last, to ensure that all relevant information has been gathered.

Table 4. Proposed Minimum Standards for Protected Area Management. Source: Carabias *et al.*, 2004

<p>1. Legal Certainty and Management Plan</p> <ul style="list-style-type: none"> • Legal certainty: <ul style="list-style-type: none"> • In accordance with national legislation; • Geographical extent and boundaries clearly established; • A general zoning scheme in place; • Resource use and other activities clearly and authoritatively regulated; • Management category is clearly stated in all relevant legislation. • Management plan: <ul style="list-style-type: none"> • Describes outstanding biological and other features of the area; • Contains detailed zoning; • Contains regulation of activities; • Contains description of programs, actions and goals; • Has been analyzed and discussed with primary stakeholders; 	<ul style="list-style-type: none"> • Approved by the relevant legal authorities; • Officially published; • Disseminated to all relevant stakeholders. • Provides procedures for inter-institutional coordination • Inter-institutional mechanisms with clear regulatory framework which includes different government sectors from national and local levels; and • Regional development plans are in place for the influence zone of the protected area <p>2. Ecological Parameters</p> <ul style="list-style-type: none"> • Size is adequate to fulfil stated conservation objectives related to: <ul style="list-style-type: none"> • Landscapes; • Species; • Environmental parameters; • Environmental services; • Ecosystem function; and
----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

- Unique natural features and events (e.g. endemic species, migratory congregations).
- Ecosystems are maintained in good condition (with identified indicators);
- The landscapes, ecosystems, species and/or environmental services that are targets of the protected area of significant value at the country or regional level.

3. Human Resources

- Responsible officer (director) in charge of coordinating all activities in place;
- Necessary personnel for law enforcement;
- Personnel are sufficiently trained to undertake their assigned tasks and duties, including interface with stakeholders and conflict resolution;
- Salaries are adequate, within national standards, and scaled to responsibilities;
- Staff are sufficiently high within the government hierarchy to be able to interact effectively with other government authorities
- A staff training programme is in place.

4. Infrastructure and Equipment

- Administration offices;
- Field stations;
- Visitors' Centre with easy access, low maintenance requirements and use of modern museum display techniques;
- Signage in place covering prohibitions, regulations, safety information, and general information about the protected area and its features; and
- Interpretative trails;
- Sufficient equipment for personnel to fulfil objectives (e.g. computers, land and water vehicles, safety equipment, uniforms, communication links.)

5. Financial Resources

- Salaries of officer in charge and staff are covered by national government;
- Basic operation expenses are covered by national government;
- Complementary activities are financed by sufficient alternative funding sources (e.g. special funds, grants, endowments, funding campaigns);
- Charges for admittance, permits, and concessions are returned to management of the area.

6. Monitoring and Evaluation

- Monitoring program in place that:
 - Establishes goals;
 - Sets time limits to accomplish activities;
 - Functions under an established scientific protocol in accordance with standardized methodologies using robust indicators; and
 - Is integrated into corrective adaptive management decision-making processes.
- Follow-up and evaluation programme that establishes goals and sets time limits to accomplish activities

7. Participatory Processes

Includes effective mechanisms for stakeholder and local institution participation, with:

- Internal by-laws
- Includes all sectors
- Representation mechanisms
- Includes a training programme for stakeholders to raise effectiveness of participation

8. Public Awareness

- Activities to ensure that neighbouring communities are aware of the existence of the protected area and associated laws governing resource use;
- Campaigns and activities to increase understanding of the values and benefits of the protected area and the rationale for actions taken to protect it; and
- Environmental education programmes for neighbouring communities that translate technical information for public use, promote dialogue, and build capacity for conservation decision-making.

9. Public Use Facilities

- Designated areas for recreational activities;
- Carrying capacity has been determined and impact of use is monitored;
- Specialised personnel dedicated to visitors;
- Accessible information for visitors;
- Waste management system;
- Adequate restroom facilities;
- Designated camping sites (if camping allowed);
- Concessions for specific services (e.g. restaurants, gift shop, transportation, guides – preferably local stakeholders).

10. Research

- Basic and applied research programmes to support protection and management, covering:
 - ecosystems and species;
 - socio-economic dimensions;
- Agreements with national and foreign academic institutions to carry out necessary research;
- Adequate regulation for sample collection and handling of natural resources to ensure no adverse impacts from research activities in the protected area.

3.5 Outputs

Assessment of **Outputs** focuses on **what products or services were produced, and what were the results?** This is not the same as assessing whether the objectives (outcomes) are being met, but rather it involves assessing progress made with the steps essential for achieving the outcomes i.e., have the necessary products been completed and services provided. Typical outputs include management plans, research reports, annual and other reports, codes of conduct/best practice guidelines, public awareness materials such as brochures, videos etc., visitor facilities, databases, marker and mooring buoys, patrols, prosecutions, training workshops, seminars, and education programmes.

If the MPA has an objective of raising awareness and understanding about marine resources, relevant outputs contributing to this might be the brochures, leaflets, posters or videos that have been produced. If an outcome is to build local capacity for management, a relevant output might be the number of local community members that have been given appropriate training. If an objective is protection of particular marine resources, outputs might include the installation of mooring buoys to mark boundaries of a no-take area, and training of rangers in enforcement techniques.

An assessment of outputs tries to answer the following questions:

- has the management plan and/or work programme been implemented?
- what are the products and services delivered as a result of management activities?

The worksheet requires that the status (i.e. degree of completion) of each of the actions/interventions in a work or management plan should be recorded (e.g. whether they are ongoing, completed, not commenced). The reasons for lack of completion or delay when actions have not been completed or are running late should be examined and described, and actions proposed to overcome any obstacles or problems. This can show where effort is being focused and which areas are being neglected, and helps to ensure that management plans are used more frequently, and not left on shelves.

Most MPAs will produce quarterly and/or annual reports detailing progress in relation to outputs and these can provide the basis for this component of the assessment.

The worksheet – Assessment of Management Plan Implementation - is also provided in Appendix 1.O and can be adapted, and used to assess the extent to

which actions in the planning documents have been completed. It is important to relate the activities to the relevant objectives and management targets, which is not necessarily done in work plans. In addition to noting the status of the action, a short description of what has been undertaken, or the reasons why an activity could not be undertaken, should be provided, as well as recommendations for the future.

If required, the summary worksheet (Appendix 1.P) can then be used to compile an overall assessment of progress made in terms of outputs.

3.6 Outcomes

3.6.1 Introduction to the concept of objectives/outcomes

Assessment of **outcomes** focuses on **what did we achieve? Have the MPA's objectives been met? Outcome assessment is ultimately what tells you if management actions and interventions have worked and been effective in terms of having an impact on the values/management targets for which the MPA was established.** Thus if an objective is to protect marine turtles, the assessment would tell you if threats to the turtles have been reduced and if populations are stable or increasing, i.e. whether the MPA has made a difference?

Objectives are generally listed under broader categories called goals (see example in Box 3). Some MPA management plans use the terminology 'mission statements' and 'purposes', which are broadly similar to goals and objectives and can also be used in an assessment of outcomes. **Goals** are general

descriptions that summarise the **ultimate desired state of an MPA**. A good goal meets the following criteria:

- **Visionary** – a positive statement outlining the desired state of the MPA.
- **Broad** – a broad and general statement that captures the vision of the MPA.
- **Brief** – short and succinct so that it can be remembered by different stakeholders that might contribute towards its achievement.

Objectives should be **specific statements** that describe the desired outcomes of the MPA, and what management is aiming to achieve. A good objective should be **SMART** – **S**pecific, **M**easurable, **A**chievable, **R**ealistic, **T**ime-bound:

- **Specific** – clearly defined so that it is understood by all stakeholders.
- **Measurable** – definable according to standard scales (e.g. percentages, numbers), and should be measurable at any point in time.
- **Achievable** – it should be quite clear when the objective has been reached.

- **Realistic** – practical and appropriate within the local context. For example, it is impractical to have an objective that excludes all local uses of resources, if local communities are reliant on the resources of the MPA to meet their food requirements.
- **Time-bound** – can be achieved within a reasonable time-scale. In general, this should not exceed 10 years, though longer (50-year) time-scales may be required for the conservation of long-lived, slow-reproducing species (e.g. turtles and dugongs), or degraded habitats with slow recruitment (e.g. coral reefs). Although the time-scale should be considered, it is not essential to include a deadline for achievement of the objective within the wording of the objective itself and it is often better not to do so.

In reality, the objectives of an MPA are often written in such a way that they are too general to be useful, or lack the clarity needed, for measuring management effectiveness. In some instances objectives are framed as activities, outputs or tools rather than objectives as such. Unless they are clear and specific, it is very difficult to identify suitable indicators to use for monitoring and assessing progress.

Box 3. Mission, goals and objectives

Kisite Marine National Park/Mpunguti Marine National Reserve, Kenya

Mission: To conserve unique flora and fauna and protect scenic islands as special habitats for endemic marine mammals and breeding sites for migratory birds.

Goal 1. To enhance biodiversity conservation through participatory approaches.

Objectives

- Create and strengthen partnerships
- Provide opportunities for public education and conservation awareness
- Maintain the variety of life
- Ensure the existence of viable populations
- Counteract threats to marine life
- Allow regeneration of damaged habitats
- Carry out research and monitoring in support of management

Goal 2. To provide suitable breeding and feeding habitats for marine organisms.

Objectives

- Ensure protection of the breeding and feeding habitats for migratory birds, turtles, fish and marine mammals

Goal 3. To promote sustainable nature tourism.

Objectives

- Generation of revenue
- Ensure visitor safety
- Ensure availability of visitor facilities
- Encourage local tourism
- Regulate tourism activities e.g. by zoning certain areas for certain activities
- Provide opportunities for staff training on visitor handling

Objectives for Cousin Special Reserve (Seychelles)

1-5 cover biodiversity and natural values; 6-7 cover socio-economic issues; and 8 covers governance:

1. To maintain viable populations of endemic land birds and internationally important breeding seabird populations on the island.
2. To maintain or establish threatened endemic plant species where appropriate, so long as this does not conflict with objective 1.
3. To maintain and enhance viable populations of the island's endemic terrestrial vertebrates and invertebrates.
4. To protect and maintain the integrity of the island's coastal and littoral habitats, especially the coral reef and its associated flora and fauna and the internationally important breeding populations of hawksbill turtle.
5. To understand and mitigate long-term and external influences.
6. To use the island's conservation features as a vehicle to raise and maintain education and public awareness
7. To maintain a safe, effective and sustainable physical infrastructure for carrying out the reserve's management plan.
8. To administer and manage the reserve in a professional manner ensuring that all Nature Seychelles standards are maintained or exceeded measures

It may therefore be necessary to reword objectives for the purpose of the assessment. For example, an MPA objective worded as 'biodiversity protected' may need to be thought of as several components that reflect the management targets of the MPA e.g.:

- (i) Fully representative habitats and thereby species and community diversity protected;
- (ii) The quality of different habitats in the MPA maintained; and
- (iii) Species and genetic diversity of marine organisms conserved.

These can then be reworded to meet SMART criteria and to address the specific management targets that have been identified for the MPA. For example, (ii) could be reworded to '*the quality of key coral reef, mangrove and seagrass habitats improved by X% by X time*'.

Table 5. Biophysical Goals & Objectives (Source Pomeroy *et al.*, 2004)

<p>Goal 1. To protect biodiversity</p> <p>Objectives</p> <p>1.1 Protect fully representative habitat types (and thereby species and community diversity) at the biogeographic region and national level.</p> <p>1.2 Protect unique biodiversity 'hotspots'.</p> <p>1.3 Conserve and maintain the quality of different habitats within the MPA.</p> <p>1.4 Conserve the species and genetic diversity of marine organisms.</p> <p>1.5 Conserve and maintain ecosystem function, structure and processes.</p> <p>1.6 Protect areas essential for the completion of life-cycle phases of species.</p> <p>1.7 Minimise threats and damage to biodiversity due to human activities inside and outside the MPA.</p> <p>1.8 Minimise threats and damage to habitats due to human activities inside and outside the MPA.</p> <p>1.9 MPA Design that adequately spreads risk from unmanageable disturbance</p>
<p>Goal 2. To conserve and sustainably use marine resources</p> <p>Objectives</p> <p>2.1 Maintain and restore resource species at sustainable harvesting levels.</p> <p>2.2 Protect vulnerable life-cycle stages of resource species.</p> <p>2.3 Prevent over-exploitation of resource species.</p> <p>2.4 Ensure non-extractive use of marine resources is done sustainably.</p> <p>2.5 Prevent destructive resource harvesting/ extraction practices.</p> <p>2.6 Improve or sustain fishery yields within MPA (if allowed) and adjacent to MPA.</p>
<p>Goal 3. To conserve individual species of concern</p> <p>Objectives</p> <p>3.1 Conserve and restore populations of rare, localised, endemic or threatened species to viable levels.</p> <p>3.2 Eliminate or reduce threats to rare, localised, endemic or threatened species.</p> <p>3.3 Prevent or remove alien and invasive species and genotypes.</p>
<p>Goal 4. To rehabilitate or restore degraded areas within the MPA</p> <p>Objectives</p> <p>4.1 Rehabilitate or restore degraded habitats.</p> <p>4.2 Restore ecosystem function, structure and processes.</p> <p>4.3 Minimise, and where possible eliminate threats, to facilitate rehabilitation or restoration.</p>

Similarly, an MPA objective 'livelihood opportunities for coastal communities improved', could also be broken down into components reflecting different aspects of improved livelihoods:

- (i) economic status and relative wealth of coastal communities improved;
- (ii) dependency of future generations on natural resources decreased by stabilising or diversifying community and household occupational and income structure; and
- (iii) coastal communities' access to markets and capital improved.

These could also be reworded to meet SMART criteria. For example, (i) could be reworded as '*the economic status and relative wealth of coastal communities increased by an extra \$10 per individual household/week*'.

Table 6. Socioeconomic Goals & Objectives (Source Pomeroy *et al.*, 2004)

<p>Goal 1: Maintain and/or enhance food security for local communities</p> <p>1.1 Improve local nutrition.</p> <p>1.2 Improve availability of locally caught seafood for food.</p>
<p>Goal 2: Maintain and provide livelihood opportunities for coastal residents and resource users</p> <p>2.1 Improve the economic status and relative wealth of coastal communities.</p> <p>2.2 Stabilise or diversify the community and household occupational and income structure by decreasing resource dependency for future generations.</p> <p>2.3 Improve coastal resident access to market and capital.</p> <p>2.4 Improve or contribute toward the health of local communities.</p>
<p>Goal 3: Maintain and provide sustainable development opportunities</p> <p>3.1 Develop sustainable tourism opportunities.</p> <p>3.2 Stimulate the rational development of under-utilised natural resources.</p>
<p>Goal 4: To enhance non-monetary benefits to stakeholders and the general public</p> <p>4.1 Maintain or enhance aesthetic values.</p> <p>4.2 Maintain or enhance existence values.</p> <p>4.3 Maintain or enhance wilderness values.</p> <p>4.4 Maintain religious and cultural values.</p> <p>4.5 Maintain or enhance recreational opportunities.</p>
<p>Goal 5: To strive towards the equitable distribution of benefits from coastal and marine resources and the costs of protection</p> <p>5.1 Equitable monetary benefit distribution to and through local communities.</p> <p>5.2 Equitable non-monetary benefit distribution to and through local communities.</p> <p>5.3 Improve equity among social groups (e.g. minority gender).</p>
<p>Goal 6: To maximise compatibility between the MPA management and local culture and practices</p> <p>6.1 Minimise adverse effects on traditional relationships/systems that support the MPA with natural coastal resources</p> <p>6.2 Maintain or enhance (material) ancestral and historical features/sites/monuments that are linked to coastal resources.</p>
<p>Goal 7: Enhance environmental awareness and knowledge</p> <p>7.1 Enhance respect and/or understanding of traditional knowledge that supports the MPA.</p> <p>7.2 Increase understanding of "sustainability".</p> <p>7.3 Increase understanding of protection, conservation and the role of MPAs.</p> <p>7.4 Increase understanding of the value, need and role of coastal and marine resources.</p> <p>7.5 Enhance scientific knowledge.</p>
<p>Goal 8: Improve and stabilise the funding base for conservation and management</p> <p>8.1 Generate funding to support conservation and management by lead institutions.</p> <p>8.2 Generate funding to support local community conservation initiatives.</p>

The objectives shown in Box 3, demonstrate some of these points. In the case of Kisite Marine Park, the objectives are worded very generally, whereas those for Cousin Island are more precise. In the latter case, the park staff were able to develop measurable management targets that could be used in the outcome assessment (see Appendix 3.A).

The WCPA-Marine methodology (Pomeroy *et al.* 2004) covers this topic, and identifies a list of generic objectives (biophysical, socio-economic and governance), which are useful to look at; they are summarised in Tables 5 and 6. At the national level, Hockey and Branch (1997) have defined generic objectives for MPAs in South Africa: 4 for biodiversity protection; 4 for fisheries management; and 6 for utilisation.

It may not be possible to revise the objectives of an MPA very quickly if they have been formalised through legislation. However, an assessment will help to identify weaknesses in them, and it may ultimately be possible to make them more measurable and useful (SMART) for management and they can then be included in any revision of the management plan.

3.6.2 Assessment of biodiversity objectives

All MPAs in the WIO have **conservation** or **maintenance of biodiversity** as one of their primary objectives (indeed, for an MPA to qualify as a 'protected area' under the IUCN definition, it must have conservation as its primary objective). An assessment of **biodiversity health** is therefore a crucial aspect of assessing management effectiveness. If an MPA is not maintaining or improving biodiversity (i.e. maintaining the ecological integrity of its values and management targets), then the management is not effective, and should be improved.

For example, if a management target for an MPA is its coral reefs (contributing to an objective relating to biodiversity conservation), coral reef health should be monitored. Commonly used indicators for reef health are relative abundance (community composition) of hard corals, percentage cover of live coral, certain groups of fish (e.g. butterfly fish) etc. Data from the monitoring programme will help to indicate if the biodiversity is being met. For example, coral cover and diversity might be increasing, which would show some progress, but it might not be happening as far as expected and through the assessment it may be possible to identify management actions that could improve the situation.

It is most important that the outcome worksheets are completed in **collaboration** with the **scientists** and **MPA personnel** who have been involved in the collection of the monitoring data and in its interpretation and analysis. Before starting, it is helpful to identify reports and scientific papers that have been published as a result of any monitoring programmes.

The worksheet (Appendix 1.Q.) is completed as follows:

Columns 1 and 2: List all **management targets**, with their objectives (as in the Management Targets Worksheet, for section 3.1)

Column 3: For each management target, briefly describe any relevant monitoring programmes. Specify the indicators (e.g. in the coral reef example above, relative abundance of hard coral species, % cover of live coral, etc.) and the methods used (e.g. line-intercept transect at 6 monthly intervals for years xx - xx etc).

Column 4: Describe the results of data analysis if this is available (e.g. has the number of coral species increased or decreased? Which coral species are most abundant? Which species are no longer present or have declined in abundance? What are the observed changes in % live coral cover, etc.). It is important to specify the dates when the data were collected. A brief description of what the results mean should also be given - e.g. if coral cover has increased, is this thought to be natural recovery, or because coral transplantation has been undertaken? List any major 'events' (e.g. mild bleaching, increase in crown-of-thorns starfish feeding on corals) that may have caused the decline in coral cover, and if there is data collected on these possible causes for coral decline, these should be stated too. If no data are available, or if this has not been analysed, it is good to say so in the assessment. Lastly, it is important to distinguish between results that have been obtained through statistical analysis of the data, and that perhaps have been published, and those that are 'inferred' or assumed just by looking at the raw data.

Columns 5 and 6: These require that there is some sound knowledge about the management target, and the situation that would be expected in an optimum situation. 'Meets preferred status' is asking whether stakeholders are happy with the status of a management target and objective. For biological targets and objectives (e.g. coral health, or healthy fish populations) some guidance may be needed from experts working in that field as to what is 'optimum'. Consideration may need to be given to historical data. For example, if hard coral cover was recorded as 80%

in the 1980s, and scientists consider this percentage essential to maintaining ecosystem functioning, than 80% cover may be the preferred status. 'Current status is reversible?' refers to whether the situation can be changed or not. It may not always be possible to fill in these columns in a meaningful way, in which case they should be omitted from the assessment.

Column 7: This should always be completed as this provides the key information for improving management of the MPA. For each management target, using the results obtained in column 4, 5 and 6 management actions that are necessary to improve or maintain the status/health of the target should be identified. Thus, if coral health appears to be declining, identify the actions needed to reverse this. Sites should be as specific as possible to enable actions to be followed up after the assessment, and should state which agency or stakeholder should take the lead on each action.

Column 8: This column should be completed only with advice from those who have done research on and monitored the target in question. It is used for making a summary statement on the health of each management target. For this to be meaningful, it is essential to have a good understanding of the target in question, and knowledge of the health of the target over time and in relation to the same target in other MPAs or adjacent regions.

An example of a completed assessment of biodiversity health is provided in Appendix 3.H.

3.6.3 Assessment of socio-economic objectives

This assessment is carried out using the same process as for the biodiversity objectives, and the worksheet template is identical (Appendix 1.R). However, monitoring of **socio-economic parameters** is a relatively new field, with methodologies still being developed and tested, and many MPAs may not have the data needed.

Most MPAs nevertheless, collect some data on resource use (e.g. fish/invertebrate catch), stakeholder perceptions or characteristics, MPA revenue and visitor numbers. For example, if an objective of an MPA that is closed to fishing is to increase the availability of food ('food security') for local communities, indicators might be the types and amount of fish being caught in adjacent areas, and the amount of money spent by households on food from other sources. If an MPA has the creation of ecotourism or recreational opportunities as a major objective, it will be important to monitor trends in the use of the MPA for these purposes. Useful indicators might be the number of overseas and local visitors to the MPA, the types of activities undertaken, the 'satisfaction' of the visitors, and the funding raised through these activities.

3.6.4 Assessment of threats status

The status of current threats is another important measure of management effectiveness. Threats were identified as part of the Context Review (section 3.1.2). In this component, each threat is assessed against the management actions being taken to see if they are being reduced. This assessment can be done by managers at a workshop, and through interviews with stakeholders. The stresses and sources of stresses for each management target were identified during the Context Review (see section 3.1). Use this information for assessing whether threats to the different management targets are being reduced, by completing the worksheet in Appendix 1.S and 1.T, using the following steps:

Step 1 - Rank each stress and its sources according to Table 7 below. Ranking for each stress should be based on the severity of damage and geographic scope of damage to the management target, as determined by the Context Review. Ranking of each source of stress should be based on the expected contribution of the source to the stress under current circumstances (i.e., given the continuation of the existing management/conservation situation). It is essential to document the rationale for the ratings being assigned.

Step 2 – Determine the combined rank (i.e. stress-source overall rank') using Table 8 below.

Step 3 - List management actions being implemented within and outside the MPA to address the sources of each stress. Note - many of the management actions may have been listed during the Assessment of Outputs (section 3.5) and should be used for this component of the assessment.

Step 4 - Rank each management action according to the extent to which it has reduced or removed the stress, using the rankings in Table 7. It is important to document the rationale for the ratings being assigned, and to give recommendations for improvement.

Step 5 - The summary worksheet can then be completed as follows:

- List all sources of stress identified for the MPA and the stress-source overall rank assigned for each target.

- Determine the overall threat rank (far right column of the table) for each source of stress. 'Rules' for this would need to be developed e.g.: 3 "High" stress-source combinations are equivalent to one "Very High"; 5 "Mediums" = one "High"; and 7 "Lows" = one "Medium."
- Determine the MPA's overall threat status (bottom right corner), using the overall threat ranks in the far right column and the 'rules' above.

3.6.5. Indicators and monitoring programmes

Long-term monitoring programmes, using appropriate indicators, are necessary to determine whether outcomes are being achieved, and so ideally all management targets relating to an objective should be monitored. For example, if an objective is to maintain the health of the coral reefs in an MPA, the reefs will need to be monitored to show changes. If they are deteriorating, this could indicate that management actions may not be effective (although

Table 7. Rankings for Threat Assessment worksheet

Stress		Source	Management action
Very High	The stress is likely to destroy or eliminate the target and it is very widespread and pervasive affecting the focal target throughout its occurrence at the site.	The source is a very large contributor of the particular stress, its primary cause.	Management actions have resulted in the removal or reduction of the stress to low levels, such that the management values are no longer being impacted upon.
High	The stress is likely to seriously degrade the target and is widespread, affecting many of the focal target's locations throughout the site.	The source is a large contributor of the particular stress, though not the primary cause.	Management actions have resulted in the reduction of the stress to low-medium levels, and the slowing or reversing of impacts to management values.
Medium	The stress is likely to moderately degrade the target and is localised in its distribution, affecting only some of the target's locations at the site.	The source is a moderate contributor of the particular stress, and is accompanied by other equal or greater contributors to the stress.	Management actions have resulted in some reductions of the stress to medium levels, but these are not significant to reverse the impacts to management values.
Low	The stress is likely to only slightly impair the target and is very localised in its distribution, affecting only a limited portion of the target's locations at the site.	The source is a low contributor of the particular stress; other sources are predominantly causing the stress to occur.	Management actions have not resulted in any significant reduction of the stress, and MPA values are continuing to be degraded.

Table 8. Combined Source-Stress rank

		Stress			
		Very High	High	Medium	Low
Source	Very High	Very High	High	Medium	Low
	High	Very High	High	Medium	Low
	Medium	High	Medium	Low	Low
	Low	Medium	Low	Low	--

the decline could also be due to external causes). If one of the objectives is to improve the livelihoods of local people, a monitoring programme would be required to show whether family incomes are improving as a result of the MPA, e.g. through increased fish catches, tourism revenue or other livelihood opportunities offered by the MPA.

Many MPAs in the WIO have monitoring programmes underway (Mangubhai, 2002) and thus will be able to provide some of the necessary data for this component of an assessment. The assessment will also help to show where improvement to monitoring programmes are needed, or whether a new programme is required.

It is important to obtain technical advice, particularly during the early design phases of the monitoring programme to ensure financial and human resource use is optimised. Experiences and skills within the region should be used where appropriate, particularly from long-term monitoring programmes underway through organisations such as CORDIO and CRCP (both based in Mombasa). Several MPAs (e.g. Kiunga Marine National Reserve in Kenya) and coastal management programmes (e.g. Tanga Coastal Zone Conservation and Development Programme in Tanzania) have also developed monitoring programmes and their advice should be sought. Where possible local people should be involved in monitoring programmes as this will help to increase their sense of involvement in the MPA, as well as reduce costs in carrying out the monitoring (Obura *et al.*, 2002). The extensive literature on how to design monitoring programmes should also be consulted (e.g. English *et al.*, 1997; Bunce *et al.*, 2000; Wilkinson *et al.*, 2003; Hill and Wilkinson, 2004).

To be useful for assessing management effectiveness, monitoring programmes must be designed to provide the data needed, which means choosing appropriate indicators (i.e. units of information that when measured over time will document change). This is discussed in detail in the WCPA-Marine guidebook, which provides a set of generic indicators covering 10 biophysical, 16 socio-economic and 16 governance issues. In this workbook for the WIO, only biophysical and socio-economic objectives are assessed, as governance issues are covered in the other components of the method. Hockey and Branch (1997) provide 17 criteria (equivalent to the generic indicators referred to in the WCPA-Marine guidebook) against which the objectives for South African MPAs can be measured.

Given the limited human capacity and financial resources at most WIO MPAs, indicators should be selected that are as simple and straightforward to measure as possible. Unrealistic indicators are often selected, that are too difficult to measure regularly with available skills and capacity, or that are found later not to measure impact or success. Selection must be based on:

- a careful analysis of the objectives and the types of changes wanted, as well as how progress might be measured; and
- an analysis of available human, technical and financial resources.

Two types of indicator are necessary: '**impact indicators**' which measure changes in the system (e.g. coral abundance as a measure of coral health), and '**process indicators**' which measure the degree to which activities are being implemented (e.g. number of patrols undertaken). A good indicator should:

- Be clearly defined and understood by all stakeholders.
- Have an unambiguous, predictable and verifiable relationship with the parameter being assessed - i.e. they should closely track the objective that they are being used to measure. For example, abundance and diversity of coral species are good indicators if the objective is to maintain healthy coral reefs
- Be based on an understanding of threats. For example, if El Niño events are a potential threat, indicators should include sea surface temperature and coral bleaching.
- Be simple to measure and interpret, cost-effective, and able to be collected, analysed and reported in a timely fashion and on qualitative or quantitative terms.
- Be consistent, so that it is always measuring the same thing, and does not change over time; it should be precise and unambiguous so that different people can measure it and get similar results.
- Reflect changes in the parameter being measured over temporal and spatial scales.
- Reflect the human capacity available - e.g. coral species diversity would be an inappropriate indicator if no one can identify corals to species level.
- Should concern just one type of data (e.g. numbers of nesting turtles rather than numbers of turtles in general).
- Must also be present frequently enough for meaningful data to be gathered - e.g. very rare species or events are generally not good indicators as there will be many 'zero' observations and trends will be difficult to determine.

Quantitative measurements (i.e. numerical) are most useful, but often only **qualitative** data (i.e. based on individual judgments) are available, and this has its own value. Selecting indicators for visible objectives or activities (e.g. mooring buoys installed, reef survey undertaken) is easier than for objectives concerning behavioural changes (e.g. awareness raised, women's empowerment increased). A few good indicators may be better than many weak ones, even if this means a compromise; for example not being able to determine overall biodiversity health.

Note that it may be difficult to attribute a change, or effect, to one particular cause. For example, an increase in nesting turtles could be due to good management of the beach or to a decline in harvesting of turtles outside the MPA. When choosing indicators, it may help to frame the objective as a question. For example, is the MPA resulting in an increase in the catch per unit effort of local fishers within a 5-year time-frame?

- It is important to choose the right method(s) to answer your question, and to ensure the method can be replicated. In some instances a combination of methods may provide better accuracy. Once decided on, the same method(s) must be used all the time to allow comparisons over time.
- Determine the right frequency for sampling. The timing or seasonality (i.e. time of year) and frequency (e.g. weekly, monthly, biannually, annually, seasonally) of sampling should remain fixed as much as possible once monitoring has commenced. Alterations to timing or frequency of sampling can reduce the strength ('statistical power') of the data, and limit the conclusions that can be made.
- Determine the right sample size (e.g. number of transects, number of sites). The larger the sample size, the more accurate are the data, and a minimum number of samples are required for the analysis to be statistically valid. However, sample size needs to be balanced against the human and financial resources available for monitoring.

4. ASSESSMENT RESULTS

4.1 Reporting assessment results

The main aim of assessing management effectiveness is to improve performance of the MPA and to ensure that an adaptive management approach is adopted. It is therefore essential that the results are carefully documented and disseminated to all those involved in management. The presentation of the results should be tailored to the individual needs of the MPA and a balance must be sought between the detail of the information and the speed and ease with which it can be assimilated and used by managers. The results might be presented in the following forms:

Verbal Report - this is the simplest option where the consultant, a member of the assessment team or senior manager summarises the findings. This allows the results of the assessment to be shared directly with other stakeholders, including those who did not participate. A verbal report however, should be accompanied by a written and more permanent record.

Written Report – the results of an assessment should be recorded permanently both electronically and on paper to enable managers to consult the document and use it to modify, adjust and improve management. In addition to the completed worksheets, there should also be a descriptive summary explaining why the various ratings in the worksheets were given, and describing key points and issues that arose during discussions. Recommendations should be clearly detailed, and the agency, section or person responsible for carrying these out should be clearly identified.

Summary Report – at some sites it may be useful to summarise the results of the assessment for a wider audience, particularly for stakeholders who may not have participated in the assessment process but who are affected directly or indirectly by the MPA. Consideration should be given to translating materials into local languages or targeting specific members of the community (e.g. local fishers, politicians and other key decision makers).

4.2. Implementing the recommendations

It is important that the assessment is well integrated into the core management system of the MPA. A process should be defined at the beginning to ensure that recommendations are followed up. As shown in Figure 3 (page 12), there are likely to be two main types of response:

1. **Adjustment of management strategies/interventions**, if the assessment shows that some aspects of management could be done better and/or more effectively, or are not being done at all and need to be started. The organisation or individual responsible for following up such recommendations should be identified as well as a mechanism to monitor progress.

2. **Development of improved monitoring programmes**, where the assessment shows gaps in information needed to determine management effectiveness.

To ensure the results of the assessment are being used to improve the management of an MPA, a summary of all the recommendations should be compiled for dissemination to relevant agencies and stakeholders. A suggested template for this is given in Table 9. It is important to identify which agency or stakeholder will be responsible for following up on a recommendation, and if other stakeholders will be involved in the follow up. Ideally this should have been done during the assessment process.

Some adjustments to management may be quick to implement with no additional costs while others such as monitoring may take more time and require additional financial support.

Box 4. Suggested format for assessment reports

1. Brief description of main characteristics of the MPA
2. Methods used – how the assessment was carried out
 - who was on the implementation team (names, positions, organisations),
 - what was each person's role and responsibilities in the assessment;
 - what meetings were held – when, where, who attended, what was discussed and what resulted.
 - how was the information gathered; list of sources (N.B. sites should keep a record of their sources of data and references)
3. Results achieved
 - Worksheets
 - Text summary of main results of the assessment and conclusions
4. Review of assessment process – identifying any constraints or obstacles
5. General conclusions and summary of recommendations

Table 9. Suggested template for summary recommendations

APPENDIX 1A. MPA OVERVIEW

Name of MPA:	
Location of MPA:	
Date MPA was established:	
Is MPA gazetted? (yes/no) - if yes, provide date:	
List legislation governing MPA management:	
Ownership details (owner, tenure, etc.):	
Leading management authority:	
Other designations (e.g. IUCN category, World Heritage, Ramsar, Man & the Biosphere):	
Size of MPA:	
Is the MPA zoned?	
List MPA zones & percentage cover:	
Are terrestrial areas included in MPA?	
Percentage of MPA that is terrestrial?	
Number of permanent staff:	
Number of casual or temporary staff:	
Number of volunteers:	
List current sources of funding for MPA (e.g. government, donors)	
Annual budget:	
Funding provided by donors:	
Key habitats found in the MPA:	
List MPA goal(s):	
List MPA objective(s):	
List 3 most important threats to MPA:	1.
	2.
	3.
List the top 3 management activities:	1.
	2.
	3.
List key stakeholders:	
List other stakeholders:	
Date of assessment:	
Name of assessor:	
Role (position):	
Contact information:	
Dates of previous assessments:	

APPENDIX 1B. MANAGEMENT TARGETS WORKSHEET

	MPA objective	Management targets	Marine protected area values (why is the value so important that this is an MPA?)	Is information on status available? (Yes/No - explain answer)
Biodiversity values				
Other natural values				
Socio-economic & cultural values				

APPENDIX 1C. THREATS (SOURCES AND STRESSES) WORKSHEET

Management target affected	Stresses	What is the severity or permanence of the stress currently? How extensive is the damage? Is the stress increasing or decreasing over time, and at what rate?	Source(s) of stress	What is the relative contribution of the source to the stress?	Does the threat occur regularly or occasionally? Specify the time-frame.

APPENDIX 1D. REVIEW OF NATIONAL CONTEXT WORKSHEET

Criteria	Guiding notes	Strengths	Weaknesses
MPA site & protected area legislation	Is the existing legislation adequate to preserve the MPA values?		
	To what extent is the legislation enforced?		
	Is the legislation effective?		
	Has implementation of legislation resulted in the preservation of the MPA's values?		
Conservation within broader government policy	How does conservation rank relative to other government policies? E.g. are there Ministries or Departments dedicated to the environment or protected areas?		
	Do other government policies relevant to the MPA contradict or undermine the MPA's objectives?		
	Is there a conscious attempt to integrate MPAs within other areas of government policy?		
International conservation conventions & treaties (See Notes in Appendix 4).	What international conservation conventions and treaties has the government signed up to that are relevant to the MPA?		
	How adequately are these implemented?		
Government support for MPA	How willing is the government to fund the MPA?		
	Does the government have the capacity and resources to manage the MPA (e.g. money, staff, training, equipment)?		
	How does the government's commitment to the MPA rank in comparison to other sectors (e.g. fisheries)?		
National protected area agency & MPA site	What is the relationship between site level and agency level staff?		
	What portion of the agency's budget goes to field operations?		
	How many times a year do central agency staff visit the MPA site?		

APPENDIX 1E. ASSESSMENT OF STAKEHOLDER ENGAGEMENT WORKSHEET

Note: For small MPAs, fill this worksheet ONCE for the whole MPA. For large MPAs, fill this sheet out for EACH management target

	Criteria	Stakeholder 1	Stakeholder 2	Stakeholder 3	Stakeholder 4	Stakeholder 5	Stakeholder 6
Relationship of stakeholders to MPA	Economic dependency						
	Negative impacts						
	Positive impacts						
	Willingness to engage						
	Political/ social influence						
	Organisation of stakeholders						
Stakeholder involvement in management	Opportunities to contribute to management						
	Level of stakeholder engagement						
SUMMARY	Overall adequacy of stakeholder engagement (Very Good, Good, Fair, Poor, None)						

APPENDIX 1F. STAKEHOLDER ENGAGEMENT SUMMARY WORKSHEET

NOTE: This is only relevant to large MPAs with numerous management targets and a wide range of stakeholders

Management targets	Stakeholder 1	Stakeholder 2	Stakeholder 3	Stakeholder 4	Stakeholder 5	Stakeholder 6	Overall stakeholder engagement for target (Very Good, Good, Fair, Poor, None)
Target 1							
Target 2							
Target 3							
Target 4							
Target 5							
Target 6							
Target 7							
Target 8							
Overall engagement of the stakeholder (Very Good, Good, Fair, Poor, None)							

APPENDIX 1G. PLANNING DOCUMENTS DEVELOPED FOR THE MPA

NOTES - use the following categories for describing the level of approval for the Plan

Legal = plan has force of law (usually has been approved by parliament or legal instrument)

Government = plan has been approved at government level but is not a legal instrument

Agency (Head) = plan has been approved at Head of Agency level

Agency (Senior) = plan has been approved at a senior level within the Agency

Draft = plan is a draft and has not been formally approved

Name of Plan	Year of approval	Level of approval of the Plan	Is the Plan being implemented?	Who is leading the implementation?	When was the most recent review of Plan?	When is the next review of the Plan?

APPENDIX 1H. ADEQUACY OF THE MPA MANAGEMENT PLAN WORKSHEET

Rating: VG=Very Good, G=Good, F=Fair, P=Poor

Principal	Question	Criteria		Rating	Explanation for rating	Next steps
Decision making framework	1. Does the plan establish a clear understanding of the desired future for the MPA? (i.e. describes the desired outcomes of management in terms that provides a guide to management and decision making by site managers)	VG	Desired future is clearly and explicitly articulated as a decision making reference point			
		G	Desired future is clearly articulated			
		F	Desired future is not clearly articulated but is implied or can be inferred from plan objectives			
		P	Plan focuses more on present issues and actions and doesn't indicate a desired future for the site			
	2. Does the plan act as a decision framework for addressing new issues and opportunities that arise?	VG	Provides clear guidance for addressing new issues and opportunities			
		G	Focuses more on addressing current issues and opportunities			
		F	Lacks clarity and does not provide an effective decision framework for the future			
		P	Focuses more on present issues and actions and does not indicate a desired future for the MPA			
	3. Does the plan provide for a process of monitoring, review and adjustment?	VG	Provides a clear, explicit and appropriate process			
		G	Provisions are present but are incomplete, unclear or inappropriate in some respects			
		F	Need for monitoring, review and adjustment is recognised but is not dealt with in any detail			
		P	Does not address this need			
Plan context	4. Does the plan outline appropriate policies, covering all key issues (environmental, social and economic), for management of the MPA?	VG	Policy requirements for the site are comprehensively identified and appropriate policies are laid out that are clearly linked to the desired future for the site			
		G	Policy requirements for the site are identified and policies are largely adequate and appropriate			
		F	Policies in the plan are inadequate or incomplete in major respects			
		P	Plan either does not provide a policy framework for the MPA or the policies are inadequate or inappropriate in major respects			
	5. Is the plan integrated/linked to other significant national/regional/ sectoral plans that influence management of the MPA?	VG	Other relevant plans are identified and specific provisions or mechanisms are included to provide for integration or linkage now and in the future			
		G	Other relevant plans are identified, their influence on the site is taken into account but there is little attempt at integration			
		F	Some plans are identified but there is no attempt at integration			
		P	No account is taken of other plans			
	6. Is the plan based on an adequate and relevant information base?	VG	The information base is adequate in scope and depth and is matched to the key decisions, policies and issues addressed in the plan			
		G	The information base is adequate in scope and depth but contains some irrelevant information (e.g. is a broad compilation of data rather than targeted to the issues in the plan)			
		F	The information base has inadequacies in scope or depth so that some issues and policies cannot be placed into context			
		P	Very little information relevant to the plan is presented			

APPENDIX 1H. CONTINUED

Rating: VG=Very Good, G=Good, F=Fair, P=Poor

Principal	Question	Criteria		Rating	Explanation for rating	Next steps
Plan Content	7. Does the plan address the main issues at the site, but in the context of the objectives set for the MPA (i.e. is the plan 'outcome' rather than 'issue' driven)?	VG	Plan identifies primary issues and deals with them within the context of the desired future for the MPA			
		G	Plan identifies primary issues but deals with them in isolation rather than in relation to the objectives			
		F	Some significant issues for the site are not addressed or the issues are not adequately addressed			
		P	Many significant issues are not addressed or are inadequately dealt with			
	8. Are the objectives and actions specified in the plan an adequate and appropriate response to the issues?	VG	Objectives and actions are adequate and appropriate for all issues			
		G	Objectives and actions are adequate and appropriate for most issues			
		F	Objectives and actions are frequently inadequate or inappropriate			
		P	Objectives and actions do not represent an adequate or appropriate response to the issues			
	9. Does the plan take account of the needs and interests of local communities living in or around the MPA?	VG	Needs and interests of local communities are identified and taken into account in decision making			
		G	Needs and interests of local communities are identified but it is not apparent that these have been taken into account in decision making			
		F	There is limited attention given to the needs and interests of local and indigenous communities and little account taken of these in decision making			
		P	No apparent attention has been given to the needs and interests of local and indigenous communities			
	10. Does the plan take account of the needs and interests of other stakeholders involved in the MPA?	VG	Needs and interests of other stakeholders are identified and taken into account in decision making			
		G	Needs and interests of other stakeholders are identified but it is not apparent that these have been taken into account in decision making			
		F	Limited attention given to the needs and interests of other stakeholders and little account taken of these in decision making)			
		P	No apparent attention has been given to the needs and interests of other stakeholders			
Plan implementation	11. Does the plan provide adequate direction on management actions that should be undertaken?	VG	Management actions can be clearly understood and provide a useful basis for developing work programmes, budgets and other plans			
		G	Management actions can generally be clearly understood and provide an adequate basis for developing work programmes, budgets and other plans			
		F	Management actions are sometimes unclear or lacking in specificity making it difficult to use the plan for developing work programmes, budgets and other plans			
		P	Management actions are often unclear or lacking in specificity making it very difficult to use the plan for developing work programmes, budgets and other plans			
	12. Does the plan identify priorities amongst the strategies and actions in a way that facilitates work programming and allocation of resources?	VG	Clear priorities are indicated in a way that supports work programming and resource allocation			
		G	Priorities are indicated but are sometimes unclear making their use for work programming and resource allocation difficult			
		F	Priorities are not clearly indicated but may be inferred			
		P	Priorities are not identified			

APPENDIX 11. DESIGN ASSESSMENT WORKSHEET

Principal	Design aspect	Strengths of MPA design	Weaknesses of MPA design	List potential actions available to address weaknesses of the MPA design
A. Ecological integrity (biodiversity management targets)	A1. Key areas Are areas critical for maintenance of the ecological integrity of the MPA included within the boundaries (e.g. nursery areas, spawning sites, seasonal habitats, refuges used by species during periods of environmental extremes)?			
	A2. Size Larger MPAs are more likely to retain viable populations and to maintain environmental quality because they can (i) sustain essential ecological processes; (ii) buffer their interiors from edge effects; (iii) have a higher chance of supporting large-scale disturbances important for the maintenance of some species; and/or (iv) support populations of animals with more than one habitat requirement that need to move in response to changing conditions. This depends, however, on the interaction between size and all the other characteristics in this table. For example, a small site may lie within a much larger managed area (e.g. fisheries management area) or have good connectivity with other sites. Some small MPAs established for particular species can be effective if management maintains the right conditions.			
	A3. External interactions Human use adjacent to an MPA has important effects on some key species and habitats depending on the MPA's size, shape and boundary location. The extent to which the MPA interacts with or is influenced by external factors is a function of the relationship between these design aspects and the management of adjacent areas. Sites with long boundaries relative to their areas will be more vulnerable to outside effects. The influence of shape will be more significant in the case of small sites where boundaries are poorly located and adjacent land or sea use is unsympathetic to conservation objectives.			
	A4. Connectivity Connectivity refers to both continuous connections between areas (corridors) or to the general 'permeability' of an area to organisms and determines the extent to which a site is isolated or part of a larger complex of useable habitats. Connectivity differs between species and depends on their mobility and behaviour and the nature of the corridors between MPAs. In the longer-term, connectivity will affect the ability of communities of species to adjust to large-scale disturbances such as climate change.			
B. Community well-being	B1. Key resources If key resources (food or other economic resources, cultural or religious sites) required by local communities are included within the MPA and access denied, this is likely to cause conflict unless adequate provision is made for access or alternative areas are negotiated.			
	B2. Size The size of the MPA can affect its potential to deliver community benefits through the provision of ecological services (e.g. beach erosion control, wave protection), or the quantity of resources that will be able to be sustainably harvested from the site.			
	B3. External interactions The presence of an MPA can impact on communities, for example, by establishing new social institutions and governance arrangements that undermine traditional community institutions or through the influx of foreign visitors. The design and location of the site will affect the extent and size of these interactions.			
	B4. Legal status and tenure Lack of clarity in legal status and tenure can impact on local communities by creating uncertainties in relation to resource access rights, and can lead to conflicts with managing agencies.			
C. Management factors	C1. Legal status and tenure The legal status of an MPA can affect the extent to which managers are able to control activities.			
	C2. Access points The location of an MPA in relation to access points such as roads can affect the ability of managers to control access to the site by people. For example, sites with multiple access points can be subject to high levels of illegal exploitation because monitoring of access points is difficult.			
	C3. Neighbours The location of boundaries of the site may influence the number and nature of neighbours and the nature of cross-boundary issues.			

APPENDIX 1J. ASSESSMENT OF RESOURCES (INPUTS) WORKSHEET

[illegible]

APPENDIX 1K. RESOURCES (INPUTS) SUMMARY WORKSHEET

Management Targets	Total resources required to implement actions				Contribution of Managing Agency		Contribution of stakeholders	
	Staff days	Staff costs	Goods & services costs	Total Costs	Staff days	Total costs	Staff days	Total costs
Totals								

APPENDIX 1L. QUALITATIVE ASSESSMENT OF INPUTS WORKSHEET

Inputs	Questions	Answers	Is this adequate ? (yes/no - explain answer and be specific)	List additional needs? (Where possible, state options for meeting these needs)
Staff	How many permanent and temporary staff are there?			
	Where are staff located? (indicate number of staff at each location)			
	What are their functions?			
	Do staff have the necessary skills and training?			
	Are there volunteers?			
	What are the contributions of partners and stakeholders?			
Funds	What is the overall budget?			
	What is the budget break-down (e.g. salaries, capital, maintenance, activities)?			
	What are the main sources of funding (e.g. internal, grants)?			
	How much revenue is generated by the MPA (e.g. park fees)?			
	What in-kind contributions have been provided?			
Equipment	What equipment is available for management?			
	Is the equipment appropriate and functional?			
	How often does the equipment need to be maintained or replaced?			
Infrastructure	What infrastructure is available for management?			
	Is the infrastructure appropriate and functional?			
	How often does the infrastructure need to be maintained or replaced?			

APPENDIX 1M. ASSESSMENT OF CAPACITY WORKSHEET

Rating: VG=Very Good, G=Good, F=Fair, P=Poor

Management targets	Existing capacity	Capacity rating	Explanation for choice of rating	Recommendations to improve capacity (e.g. training, new staff, volunteers, partnerships)

APPENDIX 1N. ASSESSMENT OF MANAGEMENT PROCESSES WORKSHEET

Rating: VG=Very Good, G=Good, F=Fair, P=Poor

Issues	Criteria		Rating	Explanation for choice of rating	Recommendations
Legislation	VG	Legislation or regulations are resulting in the achievement of management objectives.			
	G	Problems with legislation or regulations are not a barrier to achieving management objectives.			
	F	Problems with legislation or regulations are a significant but not major barrier to achieving management objectives.			
	P	Problems with legislation or regulations are a major barrier to achieving management objectives.			
Planning	VG	An approved management plan exists and is being implemented.			
	G	Approved management plan exists, but it is only being partially implemented because of funding constraints or other problems.			
	F	Management plan is being or has been prepared but is not being implemented or approved.			
	P	There is no management plan for the MPA.			
Planning (additional points)	1	There is adequate opportunity for MPA stakeholders to influence the plan.			
	1	There is an established schedule and process for periodic review of the management plan.			
	1	Annual work programmes and budgets are based on the provisions of the management plan.			
Resource inventories	VG	Information concerning natural/cultural resources is sufficient to support most or all areas of planning and decision-making.			
	G	Information on natural/cultural resources is sufficient for key areas of planning/decision making or this information is being rapidly acquired.			
	F	Information on natural/cultural resources is not sufficient to support planning and decision-making. Efforts to acquire this are limited.			
	P	Little or no information available on the natural/cultural resources of the area and efforts to acquire this information are limited.			
Resource management	VG	Requirements for management of natural and cultural resources are being fully or substantially addressed.			
	G	Requirements for management of natural and cultural resources are only being partially addressed.			
	F	Requirements for management of natural and cultural resources are known but are not being addressed.			
	P	Requirements for management of natural and cultural resources (e.g. cultural sites, tourism management) are not known.			
Control over access/use of MPA	VG	Protection systems are largely or wholly effective in controlling access or use of the MPA in accordance with designated objectives.			
	G	Protection systems are moderately effective in controlling access or use of the MPA in accordance with designated objectives.			
	F	Protection systems are only partially effective in controlling access or use of the MPA in accordance with designated objectives.			
	P	Protection systems (patrols, permits, etc.) are ineffective in controlling access or use of the MPA in accordance with designated objectives.			
Control of land uses & activities	VG	Mechanisms for controlling inappropriate land use and activities exist and are being effectively implemented.			
	G	Mechanisms for controlling inappropriate land use and activities exist but there are some problems in effectively implementing them.			
	F	Mechanisms for controlling inappropriate land use and activities exist but there are major problems in effectively implementing them.			
	P	Mechanisms for controlling inappropriate land use and activities in the protected area are not in place or are largely ineffective.			

APPENDIX 1N. CONTINUED

Rating: VG=Very Good, G=Good, F=Fair, P=Poor

Issues	Criteria		Rating	Explanation for choice of rating	Recommendations
Management intervention	VG	Management interventions required to maintain MPA's resources are being implemented.			
	G	Management interventions required to maintain MPA's resources are known but only partially being implemented.			
	F	Management interventions required to maintain MPA's resources are known but are not being implemented.			
	P	Management interventions required to maintain MPA's resources are not known or not being implemented.			
Law enforcement	VG	Law enforcement capacity is excellent.			
	G	Law enforcement capacity is acceptable but some deficiencies are evident.			
	F	There are major deficiencies in law enforcement capacity (e.g. staff lack skills, problems with legal processes).			
	P	No effective capacity to enforce MPA legislation/regulations.			
Maintenance equipment & facilities	VG	All equipment and facilities are regularly maintained.			
	G	Most equipment and facilities are regularly maintained.			
	F	Maintenance only undertaken when equipment and facilities need repair.			
	P	Little or no maintenance of equipment and facilities undertaken.			
Education & awareness	VG	There is a strong and effective education and awareness programme that is broad-reaching and supports the management of the MPA.			
	G	There is an education and awareness programme that reaches a significant portion of the users of the MPA.			
	F	There is an education and awareness programme, but it is not effective in reaching the majority of users of the MPA.			
	P	There is no education and awareness programme, and therefore little understanding of the MPA's purpose and/or its management.			
Communication	VG	There is a planned communication programme that is being implemented to build support for the MPA amongst relevant stakeholders.			
	G	There is a planned communication programme that is being used to build support for the MPA amongst relevant stakeholders but implementation is limited.			
	F	There is communication between managers and stakeholders but this is not a planned or scheduled programme.			
	P	There is little or no communication between managers and stakeholders involved in the MPA.			
Conflict resolution	VG	There is an effective and accepted process for addressing conflicts and issues as they arise.			
	G	There is a process to address conflicts and issues as they arise, and this works most of the times.			
	F	There is a process to address conflicts and issues as they arise, but this is not often followed or effective.			
	P	There is no process to address conflicts and issues as they arise.			
Communities/stakeholders	VG	Local communities and/or stakeholders directly contribute to decision making in all areas.			
	G	Local communities and/or stakeholders directly contribute to decision-making in some areas.			
	F	Local communities and/or stakeholders have input into management decisions but no direct involvement in decision-making.			
	P	Local communities and/or stakeholders have little or no input into management decisions.			
Communities/stakeholders (additional points)	1	There is open communication and trust between communities and/or stakeholders and MPA managers.			
	1	Programmes to enhance local community welfare while conserving MPA resources are being implemented.			
	1	Where permitted, harvesting of natural resources by local people is undertaken in a sustainable manner.			

APPENDIX 1N. CONTINUED

Rating: VG=Very Good, G=Good, F=Fair, P=Poor

Issues	Criteria		Rating	Explanation for choice of rating	Recommendations
Economic benefits to local communities	VG	There is a major flow of economic benefits to local communities from the existence of the MPA and a significant proportion of this derives from activities in the MPA (e.g. employment of locals, locally operated tours, etc.).			
	G	There is a flow of economic benefits to local communities from the existence of the MPA, but most of this benefit accrues from activities outside the MPA boundary (e.g. transportation).			
	F	There is some flow of economic benefits to local communities from the existence of the MPA but this is of minor significance. People from the local community are not generally employed in MPA management.			
	P	There is little or no flow of economic benefits to local communities from the existence of the MPA.			
Visitor opportunities	VG	Management of visitor opportunities is based on research into visitors' needs and wants. Plans to optimise visitor opportunities have been implemented.			
	G	Consideration has been given to the provision of visitor opportunities in terms of access to areas of the MPA and the diversity of available experiences. Policies and programs to enhance visitor opportunities have been implemented.			
	F	Some consideration has been given to the provision of visitor opportunities in terms of access to areas of the MPA or the diversity of available experiences but little or no action has been taken in this regard.			
	P	No consideration has been given to the provision of visitor opportunities in terms of access to areas of the MPA or the diversity of available experiences.			
Visitor facilities & services	VG	Visitor facilities and services are excellent for current levels of visitation.			
	G	Visitor facilities and services are adequate for current levels of visitation.			
	F	Visitor facilities and services are inadequate (either do not meet the needs of some visitors or visitor use is damaging resources).			
	P	Visitor facilities and services are grossly inadequate (either do not meet the needs of most visitors or visitor use is seriously damaging resources).			
Commercial tourism	VG	There is excellent co-operation between managers and tourism operators to enhance visitor experiences and MPA values.			
	G	There is limited co-operation between managers and tourism operators to enhance visitor experiences and MPA values.			
	F	There is contact between managers and tourism operators but this is largely confined to administrative or regulatory matters.			
	P	There is little or no contact between managers and tourism operators using the MPA.			
Management systems	VG	Management systems provide active and effective support to managers.			
	G	Management systems provide basic support to managers.			
	F	Problems with management systems partially constrain management effectiveness.			
	P	Problems with management systems (e.g. budgeting, office procedures, staff training) significantly constrain management effectiveness.			
Management systems (additional points)	1	There is a structured process for developing and allocating annual budgets for the MPA.			
	1	There are adequate systems for financial management and control, record keeping and retrieval.			
	1	There is an active training program that is addressing deficiencies in skills and developing the potential of staff.			
Monitoring and evaluation	VG	The MPA has a regular and effective monitoring and evaluation system and lessons learnt are incorporated into management.			
	G	Monitoring and evaluation is occurring on a regular basis, and most results are fed into management.			
	F	There is some monitoring and evaluation of the MPA, but this is done sporadically and results are generally not fed into management.			
	P	There is no monitoring and evaluation of the MPA and its management.			

APPENDIX 1O. ASSESSMENT OF MANAGEMENT PLAN IMPLEMENTATION WORKSHEET

*Status codes are as following (but two or more of these stages can be reached at the same time):

- | | |
|------------------------------------------------------------------|------------------------------------------------------------------------|
| 1. Action completed | 5. Routine activity but not yet implemented as required |
| 2. Substantial progress (action is making progress in ALL areas) | 6. Planning has been carried out but there has been no implementation |
| 3. Some progress (action is making progress in SOME areas) | 7. Planning is in progress for that action |
| 4. Routine activity that is carried out regularly | 8. Follow-up is reactive (some progress made but there is no planning) |
| | 9. Not commenced |

Management targets/objectives	Management actions	Timeframe	Status of Action*	Description of progress made	Recommendations

APPENDIX 1P. MANAGEMENT PLAN IMPLEMENTATION SUMMARY WORKSHEET

Management target	Number of management actions	% actions completed	% actions making substantial progress	% actions making some progress	% actions routine activity (ongoing)	% actions in planning	% actions are reactive	% actions not commenced

APPENDIX 1Q. ASSESSMENT OF BIODIVERSITY (AND OTHER NATURAL VALUES) OBJECTIVES WORKSHEET

Management target	Which objective does this relate to?	How is the status of the management target measured? (indicators & methods used)	What are the results and what do they mean?	Meets preferred status? (Y/N)	Current status is reversible? (Y/N)	Actions needed & Recommendations	Overall health rank (V.Good, Good,Fair, Poor)

APPENDIX 1R. ASSESSMENT OF SOCIO-ECONOMIC AND CULTURAL OBJECTIVES WORKSHEET

Management target	Which objective does this relate to?	How is the status of the management target measured? (indicators & methods used)	What are the results and what do they mean?	Meets preferred status? (Y/N)	Current status is reversible? (Y/N)	Actions needed & Recommendations	Overall rank (V. Good, Good, Fair, Poor)

APPENDIX 1S. RANKING CURRENT THREAT (STRESSES AND SOURCES) WORKSHEET

Management Target: _____

Stress	Rank stress	Source(s)	Rank source(s)	Stress-source overall rank	List management being implemented to address source of the stress	Rank action(s)	Comments & Recommendations

APPENDIX 1T. CURRENT THREAT-TARGET SUMMARY WORKSHEET

Sources of current threat (list all sources identified at MPA)	Target 1	Target 2	Target 3	Target 4	Target 5	Target 6	Target 7	Target 8	Overall threat rank at the site
Overall Threat Status for MPA									

APPENDIX 2. QUESTIONNAIRE TO OBTAIN STAKEHOLDER VIEWS ON THE MPA

Stakeholder details

Name(s) :

Organisation :

Position :

Contact details :

A: WHERE ARE WE NOW?

A.1. Why do you think the MPA was set up?

.....

.....

.....

A.2. What do you think are the main management targets of the MPA?

.....

.....

.....

A.3. What are the threats to the MPA? Which threats come from within the MPA and which from outside?

.....

.....

.....

A.4. Do you think the MPA and its management helps in reducing the threats?

.....

.....

.....

A.5. Do you know the regulations of the MPA and do you understand them?

.....

.....

.....

A.6. Do you see any limitations in the regulations? Yes/No? Why?

.....

.....

.....

B: HOW ARE YOU INVOLVED?

B.1. What is your own/your organisation's interest in the MPA?

.....

.....

.....

B.2. Do you think you have enough opportunities to participate in the management of the MPA? Yes/No? Why?

.....

.....

.....

B.3. How would you like to be involved in the management of the MPA?

.....

.....

.....

B.4. What contribution do you make to meeting the management targets?

.....

.....

.....

B.5. What other contribution could you make to the running of the MPA (e.g. materials, manpower etc)

.....

.....

.....

B.6. Suppose you notice a problem in the MPA (e.g. a loose buoy, dumping of waste), what would you do first?

.....

.....

.....

B.7. How do you resolve conflicts between you, the MPA management and other users?

.....

.....

.....

B.8. What positive impacts do your activities have on the MPA?

.....

.....

.....

B.9. What are the negative impacts of your activities on the MPA?

.....

.....

.....

C: MPA DESIGN

C.1. Do you think the MPA is well located to meet its management targets?

.....

.....

.....

C.2. Do you think the MPA is the right size to meet its management targets? i.e. is it too big, too small or the correct size? Why?

.....

.....

.....

C.3. Do you think the boundaries are well located? No/Yes? Why?

.....

.....

.....

D: OVERALL ASSESSMENT

D.1. What changes have you noticed since the creation of the MPA?

.....

.....

.....

D.2. What changes would you recommend to be made in the MPA?

.....

.....

.....

D.3. How would you manage the MPA if it was left to you?

.....

.....

.....

APPENDIX 3A. MANAGEMENT TARGETS - COUSIN ISLAND SPECIAL RESERVE, SEYCHELLES

	Management Objective	Management Target	Protected area values	Information on status available?
Biodiversity Values	1. To maintain viable populations of endemic land birds, and internationally important breeding seabird population on the island	<ul style="list-style-type: none"> • Maintain viable population of Seychelles Warbler (SW) at over 300 • Maintain viable population of Seychelles Fody (SF) at over 1000 • Maintain viable population of Seychelles Magpie-robin (SMR) at over 25 • Maintain breeding seabird population at current level 	<ul style="list-style-type: none"> • SW - Vulnerable endemic and range restricted species • SF - Vulnerable endemic and range restricted species • SMR - Critically Endangered species • Globally Important species • Flag ship species • Indicator species • Target for donor funding • Long term research programmes 	Yes
	2. To maintain or establish threatened endemic plant species where appropriate so long as this does not conflict with the above target	<ul style="list-style-type: none"> • Protect and enhance integrity of Pisonia dominated plateau forest community • Protect and enhance integrity of hill vegetation community • Protect and enhance the littoral fringe vegetation community 	<ul style="list-style-type: none"> • The best restored granitic island • High percentage of native plant cover • Unique important habitat that supports all terrestrial life forms • One of few alien predator free high biodiversity islands • One of only 3 Special Reserves • Few remaining areas of Pisonia forests 	Yes
	3. To maintain and enhance viable populations of the island's endemic terrestrial vertebrates and invertebrates	<ul style="list-style-type: none"> • Maintain high lizard diversity and density • Increase knowledge of invertebrates 	<ul style="list-style-type: none"> • Largest number of lizards/sq. metre in the world • Seven endemic reptile species • Large pop. of native insects • Diversity of marine inverts • Attract new research • Can be used as indicator species 	No
	4. To protect and maintain the integrity of the island's coastal and littoral habits, especially the coral reef and its associated flora and fauna and the internationally important breeding populations of hawksbill turtles	<ul style="list-style-type: none"> • Protect and enhance nesting Hawksbill turtle population • Protect integrity of coral reef and associated key life-form 	<ul style="list-style-type: none"> • Globally threatened and most important nesting population in the Western Indian Ocean • Most important biomass of fish of all MPAs in granitics • Long term data sets • Socio-cultural values • Research values 	Yes
Other natural values	5. To understand and mitigate for long-term and external influence on this site	<ul style="list-style-type: none"> • Develop hydrological and climate monitoring 	<ul style="list-style-type: none"> • Stable natural ecosystem • Protect human lives • Protect threatened biodiversity • Protect infrastructure • Increase knowledge and ability to act effectively • Maintain all reserve values for long term 	No
Cultural and social values	6. To use the island's conservation features as a vehicle to raise and maintain education and public awareness	<ul style="list-style-type: none"> • Maintain and enhance public education • Maintain and enhance research • Maintain as important Ecotourism site 	<ul style="list-style-type: none"> • Easy access to Reserve • Easy viewing of unique biodiversity • Public support for conservation • Established education/training programme as benchmark • Publicity, advocacy and awareness • Case Study/Model • New partnerships • Sustainable financing 	Yes
	7. To maintain a safe, effective and sustainable physical infrastructure for carrying out the reserve's management plan	<ul style="list-style-type: none"> • Maintain serviceable boats and engines • Maintain existing footpath system • Maintain existing buildings • Generate energy supply as much as possible from renewable resources • Maintain fresh water supply • Minimise pollution 	<ul style="list-style-type: none"> • Minimise human footprint • Proper infrastructure for reserve management • Good working/living environment to attract staff • Improved Health and Safety for staff and visitors • Model for reserve management • Case study for small island tourism 	Yes
	8. To administer and manage the reserve in a professional manner ensuring that all Nature Seychelles standards are maintained or exceeded	<ul style="list-style-type: none"> • Maintain international health and safety standards • Maintain professional personnel and financial management • Maintain high level administrative support • Maintain and enhance high level in-house and external training • Produce Business Plan 	<ul style="list-style-type: none"> • Secure visitor's experience • Effective management • Financial checks and balances • Sustainable capacity and institutional structure • Good reputation and benchmarking • Government support • Donor support • Public support for conservation 	Yes

APPENDIX 3B. REVIEW OF NATIONAL CONTEXT - MNAZI BAY RUVUMA ESTUARY MARINE PARK, TANZANIA

Criteria	Strengths	Weaknesses
MPA site & protected area legislation	<ul style="list-style-type: none"> Very positive and supports conservation Marine parks and reserve Act No.29 of 1994. Other related acts enforced to support conservation, these includes <ul style="list-style-type: none"> - Fisheries Act No. 6 of 1970. - Forest Ordinance Cap. 389 amended 2000. - Mangrove GMP of 1991 - Wildlife Act No 12 of 1974 - Tourism master plan 2002 - Local Government Reforms Programme. 	<ul style="list-style-type: none"> Some legislation needs amendments, sometimes they cause conflicting interests in the use and conservation of natural resources. Fisheries department staff not active in implementation of legislation. Benefit sharing not clearly stated.
Conservation within broader government policy	<ul style="list-style-type: none"> Conservation ranks very high Ministries/ Department concerned with conservation: TCMP, MPRU, Vice President Office, Environment Division (NEMC), MNRT, Local government reform programme, Fisheries department. Environment is nationally recognized as a cross cutting issue. 	<ul style="list-style-type: none"> Government lacks financial resources to manage MPAs.
International conservation conventions & treaties	<ul style="list-style-type: none"> Tanzania is a party to the Nairobi Convention, RAMSAR, Conventional of Biological Diversity (CBD). Conventional on International Trade of Endangered Species (CITES) 	<ul style="list-style-type: none"> Benefits of conservation not fully understood.
Government support for MPA	<ul style="list-style-type: none"> Very high in terms of provision of manpower, funds, and human resources 	<ul style="list-style-type: none"> Issue of sustainability is still questionable; most funding still comes from donors
National protected area agency & MPA site	<ul style="list-style-type: none"> Management of all MPAs is coordinated by MPRU which is answerable to the Board of Trustees under the Ministry of Natural Resources and Tourism. Clear established reporting system for all MPAs (weekly, monthly, quarterly and annually reports). 	<ul style="list-style-type: none"> Parity of responsibility between Board of Trustees and Fisheries division. Long distance between The MPRU Headquarters and MPAs (MBREMP & MIMP).

APPENDIX 3C. ASSESSMENT OF STAKEHOLDER ENGAGEMENT - KISITE MARINE NATIONAL PARK, KENYA

	CRITERIA	Stakeholder 1 Fishermen	Stakeholder 2 Scuba Diver	Stakeholder 3 Boat operation	Stakeholder 4 Individual Interests	Stakeholder 5 Tour operation
Relation of stakeholder to MPA	Economic dependency	• High Dependence on area as a source of income from spill over of fish from the MPA.	• High Take visitors to MPA for commercial purposes	• High Take visitors for snorkeling for commercial purposes	• Low Use area on rare occasions	• High Take visitors to MPA for commercial purposes
	Negative impacts	• Medium Use of Seine Nets, Dynamites, poison, Spear guns especially from neighbouring country	• Low Standing on corals causing physical damage	• Medium Visitors stepping on corals, anchoring, Noise pollution from engines, and TBT pollution	• Low Hardly use area	• Medium Visitors stepping on corals,
	Positive impacts	• Low	• Low	• Low	• High	• High
	Willingness to engage	• Very High Act as custodian of MPA	• High Report cases of abuse	• High Report cases	• High Report misuse cases	• High Assists mooring buoy installation, Report cases of abuse
	Political/ social influence	• Medium	• Low	• Medium- Occasionally group used by politicians	• Low	• Low
	Organization of stakeholder	• High Fish societies, Beach management committees, South Coast Fishermen Environment committee	• Low Each person acts individually	• High Formations of associations • Kisite Boat Owners Association • Kisite Private Boat Association	Low	• Low Perform individually
Stakeholder involvement in Management	Opportunities to contribute to Management	• High	• High	• High	• High Groups like Mkwiro Youth group interested in MPA patrols	• High
	Level of stakeholder engagement	• High	• Medium	• Medium	• High	• Medium
Summary	Overall adequacy of stakeholder Engagement	• V. Good	• Good	• Fair	• Good	• Good

APPENDIX 3D. ADEQUACY OF MPA MANAGEMENT PLAN - MOMBASA MARINE NATIONAL PARK, KENYA

Name of plan & year of approval	Level of approval of plan	Is the plan being implemented	When was the most recent review of the plan	When is the next review of the plan
Management plan Mombasa Marine Park & Reserve, 2001	Plan has been approved at head of agency level	Yes	It is yet to be reviewed. Formal evaluation and review is after a five year period	Will be reviewed in 2006

	Criteria	Assessment Rating (Very good, Good, Fair, Poor)	Explanation of Rating
Strengths of MPA management plan as a decision-making framework	Plan establishes a clear understanding of the desired future {or outcomes} of management for the MPA	Good	The plan outlines the vision (mission statement) and objectives of management, identifies future management actions and expected results. ➤ Section 2.1, 2.2 & 2.5
	Plan acts as a decision framework for addressing new issues that arise	Fair	The plan outlines the roles of various collaborating institutions that would aid the MPA management in dealing with issues that arise but does not have a good decision making framework for the future ➤ Section 2.3
	Plan provides for a process of monitoring, review and adjustment	Fair	There is recognition of the need to do a comprehensive review of the plan, but the process is not in place. ➤ Section 2.8
Appropriateness of MPA management plan	Plan is appropriate and adequate for the environmental context of the MPA	Good	The plan is largely adequate with respect to management of national parks as a whole including marine parks but the plan is not site specific ➤ Section 2.3.1.1
	Plan is appropriate and adequate for the social context of the MPA	Good	The policy identifies management of resources including the marine habitat for aesthetic, scientific and cultural purposes ➤ Section 2.3.1.1
	Plan is appropriate and adequate for the economic context of the MPA	Good	The policy addresses management of resources for the economic viability and profitability of Kenya's tourist industry
	Plan is integrated/ linked to other significant national/regional/sectoral plans that influence the management of the MPA	Good	Plan takes into account the influence of relevant national/regional/sectoral plans and attempts at integration have been made through the signing of Memorandums Of Understanding (MOU) with various institutions e.g. Coast Development Agency, National Museums of Kenya, Kenya Marine and Fisheries Research Institute etc
Adequacy of content of the management plan	Plan is based on an adequate and relevant information base	Good	Information base is adequate in scope and depth including input from the stakeholders as the management plan was circulated to them for comments and before completion.
	Plan addresses the most important and relevant issues/threats facing management of the MPA	Good	The plan identifies management issues/threats and actions to be taken but implementation has been slow due to inadequate funding ➤ Section 2
	Objectives, strategies and/or actions specified in the plan are adequate and appropriate to protect the MPAs values	Good	Objectives and actions are adequate and appropriate for most issues
	Plan takes account of the needs and interests of other stakeholders	Good	The plan identifies the needs and interests of all stakeholders, although not all needs are taken into account in decision-making. Plan recommend establishment of a formal forum for discussion with stakeholders ➤ Section 2.5.2
Plan implementation	Plan provides prioritized set of actions for achieving the desired future (or outcomes) for the MPA	Good	A schedule of management actions identified in the plan is in place, for specific issues but not for overall objectives. ➤ Section 2.5
	Plan identifies the priorities amongst strategies and actions in a way that facilitates work programming and allocation of resources	Good	The plan identifies issues, what action needs to be taken, how it will be taken, timeframe and the budget, but unfortunately inadequate funding has hampered implementation. ➤ Section 2.5, 2.6 & 2.7

APPENDIX 3E. DESIGN ASSESSMENT - COUSIN ISLAND SPECIAL RESERVE, SEYCHELLES

Design aspect	Strengths of the MPA design	Weaknesses of MPA design
A. Ecological integrity		
Key areas	<ul style="list-style-type: none"> Key species are warbler, fody, SMR, and they all have viable populations on the island. No species just confined to Cousin any longer-populations on other islands also. Vegetation communities - important as only fully restored island vegetation, but no endemic plant species. Hawksbill population is largest and most important in WIO. Highest reef fish biomass and diversity in the granitic Seychelles. MPA encompasses entire reef. Highly dependant on remaining rat free- being an island with Special Reserve status and thus not allowing free landing greatly reduces the chance of their introduction. 	<ul style="list-style-type: none"> Cannot protect turtles outside MPA, small so only holds small populations of territorial endemic bird species e.g. SMR May not be big enough to ensure excess recruitment of reef fish overspilling into surrounding seas, but there are no figures. And this was not the original purpose of the protected area - see above. Relying on tourism for sustainability means many visitors to island increases the risk of introducing invasive alien species.
Size	<ul style="list-style-type: none"> Small but also seems adequate to maintain viable self-sustaining populations of many key species. Marine area covers entire fringing reef. Compact size and shape allows monitoring, protection. Could increase effective size by grouping Cousin, Cousine and Aride as proposed in the accepted but awaited 3-island GEF. 	<ul style="list-style-type: none"> Migratory species such as turtles and some seabird species may be affected by conditions away from Cousin Vulnerable to storms e.g. Sept 2002 that can cause great damage to vegetation
External interactions	<ul style="list-style-type: none"> An island, so has some degree of isolation 	<ul style="list-style-type: none"> Close to Praslin, Mahé (populated islands) - Oil spills, Sedimentation from run-off caused by potential further development on Praslin. Storms-cyclones could cause widespread damage; global warming potentially disastrous for coral death and plateau submergence. Tuna fisheries and other fisheries outside the reserve may reduce food available to seabirds. Relying totally on tourism for income (sustainability) - if tourism numbers drop, income reduced. Having many visitors to the reserve increases the risk of introducing invasive alien species.
Connectivity	<ul style="list-style-type: none"> Potential for 3-island GEF to manage Cousin, Cousine and Aride together from Praslin to increase efficiency. Connectivity to surrounding unprotected sea is complete, i.e. not disrupted. Isolation decreases threat of accidental introductions of invasive alien species 	<ul style="list-style-type: none"> Isolation increases the cost of running the island. Must have own water and electric systems etc
B. Community well-being		
Key areas	<ul style="list-style-type: none"> Commercial boat operators gain, and larger tourism companies. Fishers may gain some knock-on effect to fish stocks using MPA as a nursery, but no quantified. 	<ul style="list-style-type: none"> No buffer zone. Illegal activity sometimes takes place at or near boundary of reserve
Size	<ul style="list-style-type: none"> MPA relatively small compared to nearby unprotected reefs, so loss of income to fishermen minimised. 	<ul style="list-style-type: none"> Fish production/protection wasn't an original purpose of the MPA.
External interaction	<ul style="list-style-type: none"> Good relationship with locals (Praslinois) and poaching is rarely a problem 	<ul style="list-style-type: none"> Occasional (rare) poaching of fish and octopus can occur within the sea part of the reserve.
Legal status and tenure	<ul style="list-style-type: none"> Secure. Legal status is clear and respected. 	
C. Management factors		
Status and legal tenure	<ul style="list-style-type: none"> Clear. Small size of reserve make policing achievable 	
Access points	<ul style="list-style-type: none"> Land access prohibited except by reserve boats as special reserve status and threat of introducing rats 	<ul style="list-style-type: none"> Can't prevent landing if boat in distress... much boat traffic around - threat of accidentally introducing rats
Neighbours	<ul style="list-style-type: none"> No boundary issues. Nearest neighbours Praslin and Cousine. Cousine is unprotected but is managed for environment and is also rat free. Long standing good relationships. 	

APPENDIX 3F. ASSESSMENT OF MANAGEMENT PROCESS - ALDABRA SEYCHELLES

Issue	Rating Guidance (Very Good, Good, Fair, Poor)	Rating	Comments/recommendations
Legislation	Problems with legislation or regulations are not a barrier to achieving management objectives	2	
Law enforcement	There are major deficiencies in law enforcement capacity (e.g. staff lack skills, patrol capacity is low, problems with legal processes)	1	Remoteness of atoll; large staff; small staff; lack of patrolling equipment
Planning	An approved management plan exists but it is only being partially implemented because of funding constraints or other problems	2	Plan needs to be understood by non-resident staff; limited funding
Resource inventory	Information on natural/cultural resources is sufficient for key areas of planning/decision making or this information is being rapidly acquired	2	Information good on some resources (e.g. tortoises), poor on others (e.g. marine)
Resource Management	Requirements for active management of natural and cultural resources are only being partially addressed	2	
Maintenance of equipment/facilities	Most equipment/facilities are regularly maintained	2	
Communication	There is communication between managers & stakeholders but this is ad hoc. Not part of a planned programme	1	
Management systems	Problems with management systems (e.g. budgeting, office procedures) partially constrain management effectiveness	1	
Visitors	Visitor facilities & services are inadequate (do not meet the needs of some visitors or visitor use is damaging)	1	
Commercial tourism	There is limited co-operation between managers and tourism operators to enhance visitor experiences and protect MPA values	2	

APPENDIX 3G. ASSESSMENT OF MANAGEMENT PLAN IMPLEMENTATION - MOMBASA MARINE NATIONAL PARK, KENYA

1. Action completed
2. Substantial progress (action in all areas)
3. Some progress (action in some areas)
4. Planning has been carried out but no implementation
5. Planning is in progress
6. Follow up is reactive i.e. some progress but there is no planning
7. Not commenced

Management targets	Management actions	Time schedule	Status of action	Comments / recommendations
All	2.5.1. Additional legislation required for management: i. Adoption of rules and regulations that are MPA specific	July 1999- June 2004	2	Regulations have been drafted and awaiting for adoption • Follow up required
All	2.5.2 Stakeholder relations: i. Review existing stakeholder and institutional arrangements with a view to making them more effective and comprehensive; Identify gaps and expand relationships as necessary.	July 1999- Dec 1999	2	MOU with fisheries is still being finalised and awaiting adoption after it is signed by the two organizations; MOU signed with CDA and KMFRI • Follow up required
	ii. Provide for legal status of stakeholder/institutional arrangements for management.	July 2000- Dec 2000	3	Meetings have been held with KMFRI to implement the MOU and the two organisations are currently undertaking joint research activities
	iii. Provide capacity building for stakeholders in order to ensure effective participation in decision-making and management by all stakeholders.	July 2000- Dec 2001	3	• Institutional arrangements with hoteliers need strengthening • Build capacity for fishermen
All	2.5.3 Land tenure: i. Review the legal status of all land within and around the Mombasa MPA.	July 1999- Dec 1999.	6	There is a problem of land use practices resulting in the loss of turtle nesting sites. KESCOM has developed a proposal to donors to look into this particular issue. • Needs follow up
	ii. Acquire and gazette critical areas for incorporation into the MPA management system.	July 1999- June 2004	2	The MPA has recently acquired an allotment letter for the area covered which includes the park and the reserve boundary. There is a boundary plan map and a legal notice for the MPA
	iii. Acquire the plot where Marine operational base is located for the construction of permanent marine park HQ.	July 1999- Dec 2000	2	The plot for the operational base has been surveyed and included in the municipal plan map for award of an allotment letter. • Follow up required
All	2.5.4 Zoning plans and zoning regulations: i. Review all existing activities, resource use, and zoning within and around the Mombasa MPA.	July 1999- Dec 1999	2	Jet ski and recreational zones identified but no zoning plan yet prepared
	ii. Carry out an EIA for all existing and potential activities and resource uses within and without the Mombasa MPA as identified during the above review.	Jan 2000- July 2000	6	Environmental Coordination Act 2000, provides for an EIA to be conducted before any activity is allowed in the MPA that is deemed to negatively impact the resources.
	iii. Produce a new plan and zoning regulations for Mombasa MPA and submit for gazettelement.	July 2000- June 2001	3	• Development of zoning plan recommended
	iv. After gazettelement of a new zoning plan and regulations, review and update the zoning plan periodically.	Continuous	7	• There is need for periodic review of the zoning areas to assess compliance of zoning regulations
All	2.5.5 Management of marine and land based activities: i. Identify and monitor land use and urban development activities that may impact on the MPA.	Continuous	5	Development activities are known and planning is in progress to monitor them. Integrated coastal management process is underway and MPA is integrated in the process • Integration of the municipal council and tourism fraternity is recommended
	ii. Build the capacity for environmentally friendly land use methods and practices through education, awareness and extension campaigns.	July 1999- December 2001	2	The management in collaboration with WCK has a programme on awareness An information center is earmarked at Jomo Kenyatta Public beach to disseminate information • Raise awareness beyond schools to local communities and hoteliers • Assess the impact on awareness
All	2.5.6 Licensing procedures: i. Review the existing licensing procedures to determine whether they are compatible with MPA objectives.	July 1999- June 2000	3	The MPA has been integrated into the tourism licensing committee and there is need to incorporate it in other committees
	ii. Ensure participation of KWS in all licensing committees, which relate to resource use in the MPA.	July 2000- Dec 2002	3	Collection of aquarium fish is not allowed in the MPA and the licensing of collectors was a concern raised by the management, so they were prohibited
All	2.5.7. Infrastructure and equipment: i. Develop the proposed infrastructure and procure the required equipment in accordance with the proposed development budget.	July 2000- June 2004	2	There is an administration office and operation base, some equipment for water assessment and diving, boats and vehicles • Regular maintenance and acquisition of remaining equipment is required

APPENDIX 3G. CONTINUED

Management targets	Management actions	Time schedule	Status of action	Comments / recommendations
Education and awareness	2.5.8 Human resource and training needs i. Review the existing staff strength and training needs with a view to determining the effectiveness of MPA management and identifying gaps.	July 1999- Dec 1999	2	Gaps were identified and consequently several of the members of staff were trained in various courses e.g. 1. Diving (6) 2. Monitoring and evaluation (4) 3. Water quality assessment (2) 4. Reef check monitoring (2) 5. Customer care (4) 6. Basic marine ecology (4) 7. Mooring maintenance (4) 8. Engine maintenance (1) 9. Disciplinary code (5) 10. Paramilitary course (34) Staff strength increased from 3 in 1986 to 32 in 2003 and staff have been trained on effective performance. Some of the training e.g. ticketing procedures have been through in house training and by experience
	ii. Deployment and training of staff for effective performance.	Jan 2000- June 2004	3	Deployment on training 1. Ticketing: all rangers deployed 2. Law enforcement: all rangers and managers 3. Reef check: 2 rangers 4. Wildlife conservation and management: all managers 5. Report writing: all managers 6. Coxwainship: all coxwains 7. Diving: 5 rangers and one manager 8. Education and awareness: 1 ranger 9. Customer care: all • Training of trainers is necessary to train those newly recruited and those transferred to MPAs from non MPA areas • Recruitment of a researcher specific to MPA is recommended
Education and awareness	2.5.9 Public awareness, education and interpretation: i. The existing education and information methods will be reviewed to determine their effectiveness in promoting and ensuring public understanding and appreciation of, and support for the MPA objectives.	June 1999- Dec 1999	6	There has been some progress on information dissemination to the public but there is need to undertake an assessment to determine the impact
	ii. Develop public awareness methodologies	Jan 2000- Dec 2002	7	Although public awareness is in place no specific methodologies have been developed • develop methodologies for different target groups
	iii. Provide promotional and educational material to the stakeholders.	Jan 2003- June 2004	2	Promotional and educational material has been provided particularly in the information huts in almost all the hotels • Production of more educational and promotional material is recommended
	2.5.10 Research and monitoring: i. Determine optimum level of resource use in the MPA.	Jul 1999- Dec 2004	7	Not implemented • Need to attempt to determine optimal use
	ii. Review the existing research policies to ensure that research programmes support MPA management.	July 1999- Dec 2000	3	There has been an attempt to identify research needs as evidenced by the annotated bibliography
	iii. Identify and prioritize research needs for MPA management.	June 1999- ongoing	2	Identification and prioritization done under the KWS & KMFRI MOU research meetings • Follow up on implementation of recommendations that emerged during MPA management and KMFRI research meeting
	iv. Initiate and institutionalize research communities to undertake management of research matters in the MPA for management needs and scientific information database development.	June 1999- Dec 2000	4	Some institutions are working closely with the management on research issues e.g. KEMFRI, CDA, CORDIO, CRCP and government chemist.
Education and awareness	2.5.9 Public awareness, education and interpretation: i. The existing education and information methods will be reviewed to determine their effectiveness in promoting and ensuring public understanding and appreciation of, and support for the MPA objectives.	June 1999- Dec 1999	6	There has been some progress on information dissemination to the public but there is need to undertake an assessment to determine the impact
	ii. Develop public awareness methodologies	Jan 2000- Dec 2002	7	Although public awareness is in place no specific methodologies have been developed • develop methodologies for different target groups
	iii. Provide promotional and educational material to the stakeholders.	Jan 2003- June 2004	2	Promotional and educational material has been provided particularly in the information huts in almost all the hotels • Production of more educational and promotional material is recommended

APPENDIX 3G. CONTINUED

Management targets	Management actions	Time schedule	Status of action	Comments / recommendations
Education and awareness	2.5.10 Research and monitoring: i. Determine optimum level of resource use in the MPA.	Jul 1999-Dec 2004	7	Not implemented • Need to attempt to determine optimal use
	ii. Review the existing research policies to ensure that research programmes support MPA management.	July 1999-Dec 2000	3	There has been an attempt to identify research needs as evidenced by the annotated bibliography
	iii. Identify and prioritize research needs for MPA management.	June 1999-ongoing	2	Identification and prioritization done under the KWS & KMFRI MOU research meetings • Follow up on implementation of recommendations that emerged during MPA management and KMFRI research meeting
	iv. Initiate and institutionalize research communities to undertake management of research matters in the MPA for management needs and scientific information database development.	June 1999-Dec 2000	4	Some institutions are working closely with the management on research issues e.g. KEMFRI, CDA, CORDIO, CRCP and government chemist.
All	2.5.11 Enforcement of regulations: i. Provide the means and incentives to ensure continued and effective enforcement of MPA rules and regulations as per CAP 376.	Jan 1999-Dec 2004	3	Currently the MPA is served by one vehicle, three boats, 4 engines with all staff trained in law enforcement. The wildlife and fisheries Act and regulations are in place • Need to work closely with stakeholders to act as watch dogs is highly recommended • Increase in night patrols is recommended
	ii. Empower, sensitize and mobilize the stakeholders to assist in the enforcement of MPA regulations. Develop codes of conduct for different resource users that will stimulate them to become watchdogs among themselves.	Jan 2000-Dec 2002	3	To some extent boat operators and some fishermen report cases of violation of park / fisheries regulations. Codes of conduct for boat operators and tourists have been developed while regulations are in place for other users. • target hoteliers on park regulations research activities and turtle information
All	2.5.12 Information management: i. Assess the existing information management system to determine their effectiveness.	July 1999-June 2000	6	There are information management systems e.g. Visitor and revenue statistics and occurrence book but there is need to improve analysis for easy retrieval
	ii. Develop appropriate information management system(s) for effective decision making with stakeholders.	July 2000-June 2003	6	Systems exist but there is need to review data / information; dissemination to stakeholders needs to be strengthened
	iii. Develop and maintain networking systems for information exchange and dissemination to various resource users	Jan 2001-	5	Some information on the MPA can be accessed through the KWS website e.g. Code of conduct for divers, but more information input is needed
All	2.5.13 EIA requirements: Develop adequate EIA requirements for all development activities around and within the park	July 1999-June 2003	3	The National Environment and Coordination Act of 2000 is in force. The management is working closely with National Environment and Management Authority which provides for an EIA to be conducted on activities in the MPA • Monitoring of activities that require EIA to ensure that they conform with the recommended guidelines

Management plan implementation - summary worksheet

Management target	No of management actions	% Of actions completed	% Actions ongoing	% Actions making substantial progress	% Actions making some progress	% Actions in planning	% Actions are reactive	% Actions not commenced
Biodiversity	22	0%	32%	32%	5%	9%	13%	9%
Tourism	22	0%	32%	32%	5%	9%	13%	9%
Research	26	0%	30%	30%	7%	7%	11%	15%
Education & awareness	27	0%	37%	31%	3%	7%	11%	11%

APPENDIX 3H. ASSESSMENT OF BIODIVERSITY OBJECTIVES WORKSHEET - COUSIN ISLAND SPECIAL RESERVE, SEYCHELLES

Management target	Which objective does this relate to?	How is the status of the management target measured?	What are the results and what do they mean?	Meets preferred status? (Y/N)	Current status reversible? (Y/N)	Actions needed and recommendations	Overall he rank (V.good good, fair poor)
Maintain viable warbler population at >300 individuals.	1. To maintain viable populations of endemic land birds and internationally important breeding seabird populations on the island.	Annual assessment of population size.	Population stable and appears at carrying capacity.	Y	Y	Continued monitoring.	VG
Maintain viable Seychelles Magpie robin population at >25 individuals.		Weekly monitoring of population.	Population stable-slowly increasing; appears at carrying capacity.	Y	Y	Continued monitoring.	VG
Maintain viable population of Seychelles fodies at >1000 individuals.		Currently population being assessed, but not regular monitoring.	Population probably stable.	Y	Y	Establish periodic monitoring	VG
Maintain all seabird populations at current levels.		Breeding populations monitored at least once every 5 years.	Populations appear stable, except perhaps a decline in Brown noddy numbers.	Y	Y	Continued monitoring.	VG/G
Protect and enhance integrity of Pisonia dominated plateau forest community.	2. To maintain or establish threatened endemic plant species where appropriate so long as this does not conflict with objective 1.	Monitoring within permanent vegetation plots.	Catastrophic change in forest structure caused by storm in 2002 but rapid recovery.	Y	Y	Ensure permanent plots re-established & monitored. Removal of alien plants.	F
Protect and enhance integrity of hill vegetation community.		Occasional surveys carried out, most recently in 2000. No regular monitoring.	Native vegetation dominant, but insufficient quantitative data to measure change.	Y	Y	Extend vegetation monitoring to hill	G
Protect and enhance the littoral fringe vegetation community.		Not systematically measured.	Native vegetation dominant. No measure of erosion or change.	?	?	Establish monitoring process	Appears G
Maintain high lizard diversity and density.	3. To maintain and enhance viable populations of the island's endemic terrestrial vertebrates and invertebrates.	Skink biomass has been measured in the past. Currently no monitoring is undertaken.	NA	?	?	Monitoring would add significantly to workload of staff. None of the lizards is endemic to Cousin alone, or highly endangered.	Appears VG/G
Increase knowledge of invertebrates.		Previous work on invertebrates patchy, not systematic.	NA	?	?	Initiate studies	?
Protect and enhance nesting hawksbill turtle population.	4. To protect and maintain the integrity of the islands coastal and littoral habitats, especially the coral reef and its associated flora and fauna and the internationally important breeding populations of hawksbill turtle.	Number of emergences and whether they result in successful nesting is monitored daily over the turtle nesting season. All turtles seen nesting are tagged.	Numbers increasing: increase in nesting females of 300% in 30yrs. Now 100 130 females nesting.	Y	?	No additional actions needed.	VG
Protect integrity of coral reef and associated key life forms		Coral species and % cover, reef growth/reduction are monitored and fish diversity is monitored every 5 years	Coral bleaching event of 1998 caused massive (>95%) coral death. Further bleaching again in 2003 though less severe, has killed many recruiting corals and species less effected in 1998. Fish diversity (>220 species) numbers and range of size classes high compared to surrounding areas.	N (reef) Y (fish)	Y	Natural recovery should continue to be protected. To trial transplanting small corals sourced from other areas. No other actions possible.	F (reef) VG (fish)
Develop hydrological and climate monitoring.	5. To understand and mitigate long-term and external influences.	None yet.	NA	?	?	Initiate study.	?

APPENDIX 3I. ASSESSMENT OF SOCIO-ECONOMIC OBJECTIVES WORKSHEET

- COUSIN ISLAND SPECIAL RESERVE, SEYCHELLES

Management Target	Which objective does this relate to?	How is the status of the management target measured?	What are the results and what do they mean?	Meets preferred status? (Y/N)	Current status is reversible? (Y/N)	Actions needed & recommendations	Overall rank
Maintain and enhance public education	6. To use the islands conservation features as a vehicle to raise and maintain education and public awareness	Local and overseas visitor numbers; school visits; media coverage of MPA	MPA well known; local people informed about MPA; consider it part of their heritage; consider it accessible	Y	N	Maintain present standard of work	VG
Maintain and enhance research		Number of researcher, number of published papers	Birds, hawksbill well researched; coral reef some research vertebrates, invertebrates, plant life little research;	Y N N	N Y Y	Need to attract more research in some areas	G
Maintain as important Ecotourism site		Number of visitors, revenue, publicity	Optimal visitor and revenue achieved	Y	Y	Very vulnerable, since depended on external factors (Sep 11, Iraq War)	VG
Maintain serviceable boats and engines		Number of boats and engines	Operational boats and engines	Y	N		VG
Maintain existing footpath system	7. To maintain a safe, effective and sustainable physical infrastructure for, carrying out the reserve's management plan	Footpath used by clients		Y	Y		VG
Maintain existing buildings		Annually maintained buildings	Buildings in good condition	Y	Y	Very costly	VG
Generate energy supply as much as possible from renewable resources		% of energy supplied by solar system	Almost 100% of energy supplied by solar, generator only stand-by	Y	N	Solar equipment extremely costly, no after sales service, no local expertise	G
Maintain fresh water supply		% of water demand met	Water supply stable	N	Y	Need more storage to supply during dry season	G
Minimise pollution				Y	?		G
Maintain professional personnel and financial management	8. To administer and manage the reserve in a professional manner ensuring that all Nature Seychelles standards are maintained or exceeded	Number of staff, length of employment, revenue, foreign exchange	Satisfied staff, good revenue stream,	Y	N	Present recession and decrease in tourism arrivals potential threat to MPA	VG
Maintain international health and safety standards		Health and safety plan operational	Right equipment to handle emergency, successful training exercise	Y	N	Maintain present status	VG
Maintain high level administrative support		Number of visitor complains; smooth running of MPA	Hardly any complaints; MPA runs smoothly	Y	N	Maintain present status	VG
Maintain and enhance high level in-house and external training		Number trained staff	Staff very competent in their jobs	Y	N	Maintain present status	VG
Produce Business Plan		Printed copy of plan	Plan done, in use	Y	N	Maintain present status	VG

APPENDIX 4. NOTES ON INTERNATIONAL CONVENTIONS, AGREEMENTS AND PROGRAMMES

LEGALLY BINDING CONVENTIONS

There are several international (multi-lateral) conventions or treaties that help to guide the establishment and management of MPAs. Countries that have signed up to these (known as 'Parties' or signatory states) are obliged to enact the necessary legislation and policies that will allow the various measures described in the convention to be implemented. The treaties themselves do not enact or enforce legislation at the national level. Individual nations are responsible for this. This normally requires the government to pass enabling legislation in order to bringing the national law into line with what was agreed internationally.

The following conventions are of particular relevance to MPAs:

Convention on Biological Diversity:

Requires that Parties establish a system of protected areas, and lays out general principles for their management, with targets by which progress can be measured; the **Jakarta Mandate** (currently being implemented in the WIO) is an 'instrument' of the Convention specifically addressing marine biodiversity, and identifies MPAs as a key tool for its protection. If a country is party to the CBD, each MPA can play a role to play in meeting the obligations of this Convention. www.biodiv.org

Convention for the Protection, Management and Development of the Marine and Coastal Environment of the Eastern African Region (Nairobi Convention):

Requires that signatory states in the WIO establish MPAs; as with the CBD, each MPA contributes to meeting the obligations of this Convention. www.unep.org/easternafrika/

World Heritage Convention:

Allows Parties to nominate MPAs, or groups of MPAs, that are outstanding examples of the world's natural heritage and that meet specific criteria as World Heritage Sites; sites must be formally designated and have some form of effective management. Only a few MPAs in the WIO are World Heritage Sites, but several potentially meet the criteria for listing. A management effectiveness assessment provides an opportunity to consider whether listing would be appropriate. <http://whc.unesco.org>

Convention on Wetlands (often referred to as the Ramsar Convention):

Allows Parties to designate wetlands of international importance, including marine areas to 6m depth at low tide.; Ramsar sites do not require formal legal protected area status but must be managed sustainably and subject to wise use. www.ramsar.org

International Convention for the Prevention of Marine Pollution from Ships (MARPOL):

Covers pollution of the marine environment by ships from operational or accidental causes (e.g. oil spills, ballast water discharge, sewage, solid waste). Allows for the establishment of Particularly Sensitive Sea Areas (PSSAs) in which shipping is regulated. www.imo.org

African Convention on the Conservation of Nature and Natural Resources:

Covers conservation and sustainable management of land, soil, water, and biodiversity. Requires parties to promote the establishment of community-based protected areas and address gaps in biodiversity conservation.

www.iucn.org/themes/wcpa/wpc2003/pdfs/outputs/africa/africa_pasconvention.pdf

Convention on the International Trade in Endangered Species of Wild Fauna and Fauna (CITES):

Requires Parties to implement procedures to sustainably manage animals and plants listed under the Convention as endangered, including their extraction and movement between different countries. Marine organisms listed under the Convention include hard corals, turtles and whales. www.cites.org

Convention on the Conservation of Migratory Species of Wild Animals (CMS or Bonn Convention) –

(includes an Indian Ocean agreement on marine turtle conservation). www.wcmc.org.uk/cms

International Convention for the Control and Management of Ships Ballast Water and Sediments –

<http://globallast.imo.org>

UN Framework Convention on Climate Change (UNFCCC):

Aimed at reducing emissions of greenhouse gases. <http://unfccc.int>

NON-BINDING INTERNATIONAL AGREEMENTS

Conventions and agreements should not be confused with non-binding international agreements. Countries are not obliged to follow these in the same way that they are obliged to follow an international convention to which they are a party, but it is often in their best interest to do so. They include:

World Summit on Sustainable Development - Plan of Implementation

The Plan promotes sustainable development in relation to conservation and the environment, and sets several targets including the establishment of representative networks of MPAs worldwide by 2012. - www.johannesburgsummit.org

FAO Code of Conduct for Responsible Fishing

Provides guidance on sustainable fisheries management, and recommends that all critical fisheries habitats should be protected. www.fao.org

FAO International Plan of Action (IPOA) for Sharks and International Plan of Action (IPOA) for Seabirds – www.fao.org

Global Programme of Action for the Protection of the Marine Environment from Land-based Activities (GPA) - www.gpa.unep.org

INTERNATIONAL PROGRAMMES AND INITIATIVES

International programmes, projects or organizations can be highly relevant to MPAs and may be able to assist with implementation and good management, but this will depend on individual arrangements with a country or MPA. They should also not be confused with conventions or agreements. Some international organizations however play important roles in helping parties implement Convention (e.g. TRAFFIC and CITES).

UNESCO Man and the Biosphere Programme

Promotes sustainable use and conservation of biodiversity by improving the relationship between people and their environment, and encouraging interdisciplinary research and policy development. Central to the programme is an initiative to develop a global network of 'biosphere reserves'. www.unesco.org/mab

Small Island Developing States (SIDS) – www.sidsnet.org

International Coral Reef Initiative (ICRI)

Is a partnership of governments, United Nations and other international organisations, multi-lateral development banks, NGOs and the private sector, focusing on the preservation of coral reefs and associated ecosystems, by implementing Agenda 21, international conventions and agreements. The Call for Action and the Indian Ocean Regional Strategy both specifically recommend the establishment of MPAs. www.icriforum.org

International Coral Reef Action Network (ICRAN)

A global partnership of international organizations, NGOs, research and conservation organizations, that is part of ICRI and focuses on sustainable development of coral reef areas through management action and information sharing. Implemented by the UNEP Regional Seas Programme at site level. www.icran.org

Global Coral Reef Monitoring Network (GCRMN)

Established under ICRI, is a global network of people, government agencies, institutions and NGOs monitoring the ecological status coral reefs world-wide, and how people use and value their resources. Countries are requested to submit an annual status report on their reefs every two years, which is used to compile a global report on the status of coral reefs worldwide.

African Protected Areas Initiative (APAI)

A Pan-African process under the New Partnership for African Development (NEPAD) established to provide guidance on protected areas and promote implementation of the African Convention. The environment plan for NEPAD also includes a specific section on coastal and marine issues. www.nepad.org

TRAFFIC

An international organization, with regional and country offices in many parts of the world, that monitors and assesses international trade in wildlife; it plays an important role in helping countries fulfill their obligations to the CITES. TRAFFIC itself is not responsible for implementing or enforcing the requirements of CITES; this is the mandate of each Party.

WWF Eastern African Marine Ecoregion (EAME) Programme

A partnership programme addressing large-scale conservation, MPAs and sustainable use of marine resources in mainland Eastern Africa. A complementary programme - **WWF Western Indian Ocean Marine Ecoregion (WIOMER) Programme** – is being established for the island states. www.panda.org

Countries working towards the conservation of Coastal and Marine Biodiversity in the Western Indian Ocean.
