

Establishing a Mechanism to protect terrestrial and aquatic organisms and its conservation from pollution through awareness of people to increase their readiness to protect the environment. Most of existing areas in developing countries are not protected and have lands or territories and resource but governmental actions not taken against factories, industries and or other activities in the country.

IUCN might focus on terrestrial and aquatic systems to identify biodiversity of species and recognize species under environmental pollution effect.

Environmental Management System required starting from objectives, scopes and criteria for achieve objectives. For this purpose, IUCN needed to cover these locations and systems particularly aquatic and terrestrial ecosystems in which organisms might affected from activities particularly in areas which lack scientific studies studies.
